FACSIMILIA

Game design: how the world works

This is the design plan for the game: every system, what it does, and the reasoning behind it. Each chapter opens with a short summary in plain English; the detail after it is for when you want the full picture.

(DECIDED) settled and either built or ready to build

(PROPOSED) drafted, waiting for your approval

(OPEN) not decided yet, or a value to tune later

Made from MECHANICS.md on 18 October 2026.

Contents

Design decisions

Next decisions

Playable decisions

Core interaction principle: the brush stays authoritative

Layers

- Invariant: ownership on organized land lives on the province, not the cell
- Provinces as built

Unclaimed vs. unorganized land — two different things

- Settlement naming threshold — percentile rank, with hysteresis

Population & settlement engine

- 1. Historical gravity: the attractor field
- 2. Heatmap-to-population translation
- Historical ceiling: only the player exceeds history
- Capital growth bonuses
- Starting and seed populations
- Growth drivers: what makes people, and what moves them
- 3. Settlement naming and spawning
- Geographic regions — the ancient geographers' map

Resources and the land

- Three tiers, not one list
- The land layer
- Each crop and herd its own profile
- Change over time: four speeds
- History as the guide, here too
- Goods list: additions and grouping
- Goods and recipes
- Harvests, weather and renewable stocks
- Trade
- Labour and people
- What it feeds
- Suggested build order within step 2
- The land layer as built
- Crop yields and carrying capacity

Cultures and loyalty

Score and goals

Armies and sieges

Pretexts, war exhaustion, peace terms, alliances and vassals

Buildings, province tabs, province taxes and remedies

Technology, administrative reach, corruption, rivals and score categories

Plagues, disasters and each realm's coin

Trade routes

Town names from Pleiades

Our own 300 BC borders, 56 realms, any realm playable

Playability, part 1

The economy rebalanced

Battles and generals, part 1

Battles and generals, part 2: marching, supply and fog

Battles and generals, part 3: the battle map, sea battles, blockades

Trade: your follow-up answers

Treasury and money: your follow-up answers

War: veterans as reserves

Other realms: grudges, coalitions by history, a new ruler's temper

War: mercenaries: contracts, loyalty, elite bonuses, captains who seize land

War: generals grow

Treasury and money: State monopolies

Units of their own, the roster, and War: manpower

Technology and knowledge: your follow-up answers

Provinces, part one

The Bronze Age and the opening

- The opening

Buildings and works, part three: roads

Buildings and works, part three: canals, great works and frontier walls

Your answers of 11 October 2026
- Buildings and works
- Cities and settlements
- Diplomacy
- Government, laws and administration
- Land, resources and goods
- Population and people
- Provinces
- Sound and music
- The court: characters and families
- The map
- Time and turns
- Trade
- War: armies, units and generals
- War: mercenaries
- War: reforms
- Built from these answers

Buildings and works, part one

Buildings and works, part two: wonders

Battles and generals, part 4a: mercenary companies

Dynasties and characters
- People: skills, traits, faith, blood, reputation and bonds

New concepts needed

The five simulation systems

Might: the unified strength score

Annexation UX: fog of war and the floating confirmation panel

Annexation resolution

Suggested build order

Your answers of 12 October 2026
- Buildings and works
- Fog of war: what your realm knows
- History: events, people, migrations and new realms
- Interface
- Other realms
- Provinces
- Saves, speed and data

Sound and music
War: armies, units and generals
Voices
The interface's ornament

Your answers of 15 October 2026

Culture and religion
History: events, people, migrations and new realms
Treasury and money
War: campaigns, marching, supply and sieges
War: generals
War: pretexts, peace and treaties

Your answers of 15 October 2026, second set

Saves, speed and data
Time and turns
Technology and knowledge
War: manpower

Your answers of 16 October 2026

Your answers of 18 October 2026

Design decisions (decided, 25 Sep 2026)

In short

Your answers to the big design questions: sandbox with optional goals, realms that make their own choices but lean on history, full war and diplomacy, historical new realms plus revolts, culture and religion, player-chosen pacing for long games, tribes that start unorganized, and personal unions guided by history.

Answered by the designer in the Facsimilia Ledger. History is the guiding factor throughout: where these leave room, follow what really happened unless the player is involved.

- **Goal: sandbox with optional goals.** The game never has to end. It tracks a score and offers goals (hold a region, outlast rivals, rebuild Alexander's empire…) that the player may chase.
- **Other realms: their own choices, with history as a pull.** Realms decide for themselves but lean toward what they historically did, more strongly where the player isn't involved. (This matches the population engine's design: bots follow history, the player can bend it.)
- **War and diplomacy: full.** War must be declared before painting into a realm; peace deals end it; alliances and vassals exist. Conquest by painting (build step 7) works inside a declared war.
- **New realms: historical arrivals, revolts and civil wars.** New realms appear at their real dates and places (Galatia 278 BC, Parthia 247 BC, …). Revolts and civil wars follow history too, *unless* they happen in the player's lands or the player causes them; there the simulation decides.
- **Culture and religion: both**, with conversion and assimilation over time; together they drive integration (build step 6). Characters already carry naming cultures.
- **Pacing: the player chooses years per turn.** Games are meant to be long: a playthrough taking weeks or months is the target, not a problem. Design for depth over speed.
- **Frontier tribes start unorganized** (built): the Iberian, Gallic and Scythian peoples were confederations, not administered states, so their land starts with no provinces and follows the unorganized-land rules.
- **Personal unions: allowed, guided by history.** One ruler may inherit a second throne. The realms stay separate unless history merged them; if history renamed the realm on inheritance, the game does too. A union only splits again when the player is involved or history split it. (Not built yet: until it is, a monarch is still passed over for a second throne.)
- **Growth drivers: approved as drafted** (see Growth drivers).
- **Resources: every good simulated, shown by family.** All the goods are tracked; screens lead with about 12 families and open to the detail.
- **Resources follow history for other realms.** Mines, forests and soils under bots change the way they really did (Laurion's silver fading, Lebanon's cedars cut, Mesopotamia's soils salting); only the player can do better or worse than history.

- **Seasons: a yearly weather draw.** Each year draws its weather from each place's climate (good and bad harvests, droughts, floods); the sailing season limits sea trade.
- **Labour comes from the population, following history in full.** Workers are free, dependent or enslaved, as history had them. "History is king": people were traded, so the slave trade exists as it did, and slavery is outlawed when and where history outlawed it.
- **Land data: real datasets, with hand fixes** where they're wrong for 300 BC. Every source must allow the game to be sold: CC0, CC BY or public domain only, never "non-commercial" or "share-alike" (a test enforces it). The data is fetched by a script and the baked result is in the repository.

Next decisions (answered by the designer, 28 Sep 2026)

The designer's answers for sections 11-15 (a note overrides the chosen option where they differ). Playability (section 15) comes first.

1. **How battles are fought: A tactical battle map** (You move units on a field, like Total War. Much larger to build.)
2. **Who leads armies: Your family and courtiers** (Sons, brothers and trusted men lead; each has a skill; they can die, win glory, or rebel.) Designer's note: The royal family would die out sooner than later with this mechanic so make sure to add appointed generals, some are random events like "prince gaius imperius has met a roman of great prowess and has elevated him to general" except more roman englishy lol, and then some can be done by the player, it can be important people (a game mechanic that grants perks like in the civ games.
3. **How armies move: March by months within the year** (An army follows roads and rivers month by month; enemies can meet it on the way.) Designer's note: The route should be plottable also though, tying into the terrain update that will add features and obstacles
4. **Supply and winter: Supply lines and baggage** (Depots, convoys, foraging choices.)
5. **War at sea: Sea battles and blockades** (Fleets meet at sea, the loser's ships sink or are taken; a fleet off a port cuts its trade and supply.) Designer's note: Interactive battles just like land and air
6. **How you see a battle: A battle report** (The field, both armies by unit, the plan each chose, losses, the general's fate, a named battle ('the battle of Heraclea').)
7. **Fog of war: What your realm knows** (You see your neighbours, your trade partners and where your armies and envoys are; far lands are sketched, armies unseen.)
8. **Mercenaries: Named companies** (Real bands for hire from their homelands, costly, loyal only while paid; they may turn if unpaid (like Carthage's Mercenary War).)
9. **Veterans and army reforms: Both** (Units gain experience in battle and lose it to losses; techs and laws (like the Marian reforms) change how armies are raised and paid.)
10. **How other realms wage war: History's aims, sound tactics** (They pursue their history's aims but march sensibly, gather armies, defend their capitals and make peace when losing.)
11. **Rulers' abilities: Skills and traits** (War, diplomacy, stewardship and learning (0-20), plus traits (brave, cruel, pious, wise) that change them and how others see the ruler.) Designer's note: More than just 4 skills
12. **Do you play the realm or the family?: Choose at the start**
13. **Choosing heirs: Name an heir within the law** (You may name any son (or, where the law allows, daughter) as co-ruler; passed-over siblings may resent it.)
14. **Arranging marriages: You arrange them** (Offer a son or daughter to another court; a match brings opinion, alliances and claims.)

15. **A council of offices: A few offices** (General, treasurer, envoy, high priest, steward: each held by a character whose skill changes the matching part of the realm.) Designer's note: More than a few, about 8 is good.
16. **Republics and leagues: Elected magistrates** (You play the state; each year two consuls (suffetes, strategoi…) are elected from the leading families; their skill and ambitions shape the year; you lead one family among them.)
17. **Plots and ambitious nobles: Detailed intrigue** (Spies, schemes, secret alliances.)
18. **Faces for characters: Coin-style profiles** (Generated profiles in the style of ancient coins, by culture, age and sex; cheap and fitting.)
19. **Child rulers: A regent rules** (The mother or an uncle rules until the child is 16; regents may grab power.)
20. **A court screen: A family tree and court screen** (Ruler, spouse, heirs, courtiers, their ages, skills and traits; click to arrange marriages or appoint offices.)
21. **Events with choices: History's and chance events, with choices** ('Pyrrhus asks for ships', 'A comet is seen', 'The grain fleet is late': two or three choices with trade-offs.)
22. **History's great people: Born into their families when history had them** (If the family still exists, the person is born with fitting skills; otherwise not.)
23. **Great migrations: Moving peoples** (A people arrives from the map's edge at history's date as a wandering host that seeks land; it can be fought, bought off or settled.)
24. **New realms rising: History's plus successful revolts** (At history's date, if the land is weakly held, a new realm breaks away; any revolt that wins becomes a realm.)
25. **Religions spreading: They spread along roads and trade** (A faith appears where it began and spreads by trade routes, cities and missions; rulers can adopt, tolerate or persecute it.) Designer's note: History influences this.
26. **Peoples changing culture: Slowly, by rule, towns and schooling** (Provinces long ruled by another culture, with its colonies and cities, drift towards it over generations.)
27. **Great works: Yes, each once in the world** (Costly, slow to build, with lasting effects and score.)
28. **When the game ends: To today** (As the tech tree assumes: 2,300 years.)
29. **How strongly history pulls: A setting at the start** (Light, moderate or strong pull, chosen for each game.)
30. **What disasters do beyond deaths: More effects** (Plagues cut manpower and taxes and spread along trade; quakes destroy buildings; famines raise unrest; your choices (quarantine, relief) help.)
31. **Cities of their own: Cities with size and buildings** (Each town from Pleiades can grow through size tiers (village, town, city, great city); buildings go in cities; cities make crafts and trade, the countryside food.)
32. **Founding cities and colonies: Yes** (Pay silver and settlers to found a city or veteran colony; it grows, spreads your culture and loyalty, and anchors your rule.)

33. **Laws and policies: A set of laws** (Citizenship (who counts), land (big estates or smallholders), grain dole, slavery, levy, religion; each with trade-offs and some needing techs.)
34. **Changing your government: Through reforms or civil war** (Each form has its own rules; changing needs support or a civil war.) Designer's note: influenced by history
35. **Debasing the coin: Yes** (Strike more coins from the same silver: quick money, then prices rise, trade partners distrust your coin, and unrest grows.)
36. **Prices by place: Prices by market** (Each realm (or trade hub) has its own prices; goods flow from cheap to dear along the routes.)
37. **Borrowing: Lenders and other realms** (Temple treasuries, bankers and rich realms lend at interest; default angers them.)
38. **Building roads between provinces: Draw roads between cities** (They cost silver and years, speed armies, lower trade costs and extend administrative reach.)
39. **Mines running out: Yes, slowly** (Rich veins thin over centuries; new techs and prospecting find more.) Designer's note: Primarily according to history
40. **Slave revolts: Yes** (Where many are enslaved and treated harshly, revolts break out and can grow into armies.) Designer's note: Outside of players realm, only if history permits
41. **Learning to play: Both**
42. **An outliner of what needs attention: An outliner on the side** (Armies, sieges, wars, offers waiting, provinces near revolt, research done; click to go there.) Designer's note: collapsible
43. **Time passing: Month-by-month time with pause** (Needs monthly marching and events.)
44. **More map views: Culture, religion, loyalty, wealth, people, diplomacy** (Diplomacy shows allies, vassals, rivals and wars from your view.)
45. **Hover information: A small card** (Province, owner, people, culture, loyalty, garrison, the nearest town.)
46. **Comparing realms: A realms table** (People, land, silver, income, army, fleet, techs, score, sortable; plus graphs over time.)
47. **When your game ends: A history of your realm** (Score by category, a map of your peak, your rulers and great deeds, graphs of people and wealth over the centuries.) Designer's note: Alongside this should be a score of how close or far from history the player ended up
48. **Music and sound: see note** Designer's note: Create a second music ledger with the ideas and what kind of music you think we should have alongside what it will be used for, and I will make it myself.
49. **The look changes with the ages: Yes, by era** (Antique, late antique, medieval, early modern and modern themes: fonts, colours, ornaments.)
50. **How fast a turn must be: Under 3 seconds** (Room for more simulation.)
51. **Changing the game's data: Documented data files** (A guide to each file so you (or others) can add realms, events or techs, checked on load.)
52. **Envoys and relations: Envoys and gifts** (Send envoys (characters) to improve relations, sound out alliances, demand tribute or insult; gifts of silver or goods.)

53. **Client kings and leagues: Client kingdoms, leagues, protectorates** (Clients keep their kings but follow your foreign policy; leagues share a war policy; protectorates pay for protection.)
54. **Civil wars: Yes** (A rival claimant, a rebel general or a split senate takes part of the realm and armies; the war ends when one side wins.)
55. **What 'playable' means first: Playability: outliner, tooltips, map views, tutorial (section 15)**

Playable decisions (answered by the designer, 26 Sep 2026)

The 32 "Playable" questions in the Ledger. Where the designer's note adds to the chosen option, the note wins.

1. **Borders' licence: redraw the 300 BC borders ourselves** from open sources, so no GPL data ships with the game.
2. **Turns: 1, 5, 10 or 25 years**, default 1 (built).
3. **Long turns stop at major events** concerning the player (built).
4. **Money: each realm's own coin** (denarii, drachmae, shekels…), with silver weight behind them for comparison.
5. **Taxes: one rate you set**, with optional per-province rates.
6. **Running out of money: historical remedies**, offered according to the realm's situation at the time (borrow from temples, debase the coin, confiscate, sell offices or land…).
7. **Goods: every good matters from the start** (built).
8. **Trade: trade routes from the start**, not a pooled market.
9. **Armies: named armies based in provinces**, each with its own list of units (so many elephants, so many pikemen, so many scout ships).
10. **Units: every culture's own units.**
11. **Manpower: historical shares** of people who could serve (built).
12. **Conquest: sieges over years**, decided by the defending troops in the province and the realm's overall Might against the attacker's troops in its provinces and overall Might.
13. **Limit per turn: reach and supply** (built: reach).
14. **Sea: ships needed to cross** (built).
15. **War: declare on anyone, but pretexts matter.** Inspired by Stellaris' casus belli system, without copying it.
16. **Peace: terms by war score**, plus war exhaustion so peace can be forced. Defenders (realms and even single provinces) may offer things to appease an attacker, but only when the attacker is the player or history allows it.
17. **Alliances and vassals: in the first playable version.**
18. **History's pull on other realms: both** events at their dates and goals they pursue (built: goals).
19. **Other realms treat the player as history would** (react to threats, rivals, opportunity).
20. **Cultures: every people**, finely divided.
21. **Integration: historical pace** (built).
22. **Revolts: unrest builds, then revolt** (built).
23. **City names: the Pleiades gazetteer** (CC BY).

24. **Technology: a tech tree you choose from**: an advanced, complex web of techs that unlock as time passes but must still be researched.
25. **Empire size: administrative reach**, plus corruption and rivals, in a historical but playable way.
26. **Score: people, land, wealth, culture and dynasty**, shown separated by category (like Stellaris' final score).
27. **Goals: a starter set** (built).
28. **Plagues, famines and disasters: history's own plus chance.**
29. **Difficulty: none.**
30. **Playable realms: any realm on the map.**
31. **Province panel: essentials plus detail tabs.**
32. **Buildings: a core set** to begin with.

Core interaction principle: the brush stays authoritative

IN SHORT

You shape the world with one tool: a round brush. Conquest, provinces and anything added later all use that same brush, instead of menus or separate editors.

The existing left-drag-to-paint / right-click-to-clear ownership brush (`src/World/MapView.cs`, `PaintRadius`, the proposal overlay) is the one mechanic everything else builds on top of, not around. Every new layer described below reuses that same brush code path (radius stamp, drag-paint, dirty-cell tracking) rather than introducing a different interaction paradigm (no click-to-select-a-region UI, no modal province editor). New layers just give the brush a different target to paint onto.

Layers

> **IN SHORT**
>
> The map is stored as stacked layers over the same 45-million-cell grid: who owns each spot, which province it belongs to, and how many people and resources are there. A province's numbers are always added up from its cells, so redrawing a border can never break anything. "Provinces as built" describes what is in the game today.

Three per-cell layers, all the same 8192x5476 shape as the existing ownership grid:

1. **Ownership** (`OwnershipGrid.cells`, existing) — which realm holds this cell. Painted directly today (immediately, no commit step yet).
2. **`province_id`** (new) — which province this cell administratively belongs to. `0` = unorganized. Brush-editable in a "province mode" that targets this layer instead of ownership, with a selected target (an existing province of yours, to expand it, or "new province", to found one).
3. **Density fields** (new) — population and raw-resource presence. Population is **live, not baked**: it's `C * H_final^k`, recomputed each population tick from the blended simulated and historical heatmaps (see Population & settlement engine, below). HYDE (see Might, below) provides the historical side of that blend and seeds the 300 BC starting state. Raw-resource presence is still baked at world-gen from terrain data already loaded for the terrain shader. Not normally player-painted (geography/history-driven), though the same brush code could hand-adjust them in a dev/authoring context.

Provinces never store population/resources as an opaque blob — a province's stats are always the sum of the density fields over whatever cells currently carry its `province_id`. This is what makes provinces safely brush-editable: resizing a province's boundary just changes what it sums over, nothing needs manual splitting/merging logic. (DECIDED)

Invariant: ownership on organized land lives on the province, not the cell

For a province (`province_id != 0`), the *province* is the authoritative owner (`realm_of_province[province_id]`) — every member cell is owned by whoever owns the province, always wholly, never partially. `OwnershipGrid. cells` still holds a per-cell realm id (unchanged, so the renderer and existing tests keep reading it exactly as cheaply as today), but for organized cells it's a write-through cache: whenever a province's owning realm changes, every one of its member cells gets bulk-written to match in one pass — the same bulk-write pattern `_seed_real_civs` already uses for the political mask — never decided cell-by-cell.

For unorganized land (`province_id == 0`), there's no province to defer to: `OwnershipGrid.cells` is the sole, direct source of truth, exactly as it works today. Ownership there still changes cell-by-cell via the brush, independent of any province. (DECIDED)

Provinces as built (decided, built — build step 1)

Code: `src/World/Provinces.cs` (the layer and records), `src/World/ProvinceGenerator.cs` (the 300 BC provinces), `src/World/MapView.Provinces.cs` / `MapView.ProvinceBrush.cs` (drawing, selection, brush), `src/UI/Hud.Provinces.cs` (panel and map modes). Test: `ProvinceTest`.

- **Layer.** One province id per cell (`ushort`, 0 = unorganized), saved as `provinces.bin` beside the grid; names and owners go in `state.json`. Stats are always summed over cells (area now; population from the engine).
- **The 300 BC provinces.** `data/province_seeds.json` lists 245 historical regions c. 300 BC (Latium, Campania, Attica, Babylonia, Media, the Egyptian Delta, Meroe, Celtiberia, Arvernia, Taurica…). Each one on a realm's land becomes a province of that realm; provinces grow from their seeds over the realm's own land until they meet, then their shared borders get a gentle meander. Wherever land is more than ~150 km from any region, an extra province is added and named from the nearest region ("Northern Media"). Unseeded islands under ~1,500 km² join the nearest province. Result: two-thirds of them historical names, median ~21,500 km², about 190 provinces in all. The frontier tribes (Iberia, Gaul, Scythia) start unorganized, with no provinces (see Design decisions).
- **On the map.** Province borders are thin and fainter than realm borders, getting stronger as you zoom in; province names appear from about 2x zoom. Unorganized owned land shows paler. The selected province is lightened and outlined in gold.
- **Map modes** (HUD buttons or keys 1-3): *Inspect* (click selects a province, drag pans), *Provinces* (the province brush), *Conquest* (the old proposal brush, not yet playable).
- **Province brush.** Same round brush as conquest, a constant size on screen. Left-drag adds the player's own land under it to the selected province (one of the player's); right-drag takes land out of any province, leaving it unorganized. It never touches other realms' land. *New Province* founds an empty one to paint into; a province whose last cell is painted away disappears. The player can rename their own provinces in the panel.
- **Invariant.** `ProvinceMap.SetRealm` hands a whole province to another realm and rewrites every member cell's ownership in one pass.

Unclaimed vs. unorganized land — two different things

IN SHORT

Unclaimed land has no owner at all. Unorganized land has an owner but no province yet, so it is weaker: no taxes, only dirt roads, just a local militia. That weakness is the reason to organize land you take.

Easy to conflate, so pinning it down: **unclaimed** land (`owner_id == 0` in the existing ownership grid — today's "wild" cells) has no owning realm at all. **Unorganized** land has a realm owner, just no province yet (`province_id == 0`). They share one mechanic and diverge on everything that depends on having an owner to credit output to.

Population is a base geographic fact, independent of ownership — the density field (see Layers, above) exists on *every* land cell, unclaimed or not. Unclaimed land has its own (typically sparse) native population, same as unorganized or organized land does. Local militia strength derives from that population everywhere it applies: unclaimed land resists incursion the same way unorganized land resists conquest, scaled by however populated it actually is. What differs is output — unclaimed land has no owning realm to credit raw resources to, so **it produces nothing for no one**, even though the same coal/ore/water/flora deposits are physically present in its density field. The moment it's claimed and becomes unorganized territory of some realm, that realm starts drawing the base-rate raw output described below. This also refines the earlier assumption that settling unclaimed land is an unconditional freebie: it's cheap in practice (native population, and therefore militia, is usually sparse) but not literally free — it still resolves against whatever local defense exists. (DECIDED)

Newly gained land (settled or conquered) defaults to `province_id = 0`. It's real territory, but capped well below an organized province:

Capability	Unclaimed (no owner)	Unorganized (owned, no province)	Organized (in a province)
Population	Yes — sparse, native	Yes	Yes
Raw resource extraction (coal, ores, water, flora/fauna)	None — no owner to credit it to	Yes, base rate, credited to owner	Yes, improvable with infrastructure
Resource processing	No	No	Yes
Roads	None built; at most a natural/trade trail passing through	Dirt & gravel only	Full tiers as tech allows
Electricity routes	Cannot pass through	Cannot pass through	Allowed once unlocked

Capability	Unclaimed (no owner)	Unorganized (owned, no province)	Organized (in a province)
Military / defense	Population-scaled local militia, resists incursion	Population-scaled local militia, non-deployable	Full army stationing + logistics
Taxation	None (no owner)	None	Yes
Named settlements	Suppressed, same highly-populous exception applies	Suppressed, same highly-populous exception applies	Full, plus founding new ones

Deliberately weak defense on both unclaimed and unorganized land is the incentive to actually organize conquered/settled territory rather than leave it as paperwork. (DECIDED)

Settlement naming threshold — percentile rank, with hysteresis

Supersedes the earlier "10% of the world's largest settlement" rule (and the flat 50,000 placeholder before that). Both of those measured *size*; what the rule actually needs to protect is *map readability*, and that's a question of how many labels are on screen, which a percentile controls directly. Full rules, including where the populations being ranked come from, are in **Population & settlement engine**, below. Short version: a population cluster gets named when it enters the top **2-5%** of active clusters, and keeps its name until it falls out of the top **20%** or hits zero. This is the "highly populous exception" the capability matrix above refers to. It applies the same way on unclaimed, unorganized, and organized land.

(DECIDED)

Population & settlement engine

Three stages, run in this order every population tick:

1. **Blend** the simulated and historical heatmaps into one `H_final`.
2. **Translate** `H_final` into a target population per node, and move each node's actual population a limited step toward it.
3. **Rank** clusters by population, and name or un-name settlements.

1. Historical gravity: the attractor field

Two heatmaps are kept, both normalized to 0.0-1.0 per node:

- `H_sim` (simulated heat) is driven by gameplay: food, water, trade routes, infrastructure the player or AI builds, war damage.
- `H_hist` (historical target heat) is a static, invisible reference, never shown to the player. It carries e.g. a heavy spike over Rome or the Nile Delta in antiquity.

```
H_final = (1 - α) * H_sim + α * H_hist        α ∈ [0.15, 0.20]
```

A convex blend of two 0-1 fields stays in 0-1, so no renormalization is needed. Since `H_final ≥ (1 - α) * H_sim`, a player who builds heavily in a historically barren region always keeps at least 80-85% of their own heat there. `H_sim` overpowers the historical pull, which is what makes alternate history possible. (DECIDED)

Source of `H_hist`: HYDE, not a hand-authored map. (decided) HYDE is already the decided source of the population density field (see Might, below), and it ships gridded population snapshots from 10,000 BCE to the present (the game uses HYDE 3.2.1, which ends at 2017). That's exactly a sequence of historical target maps, baked onto this projection by `build_population_mask.py`. So `H_hist(year)` = the HYDE snapshot for that year, normalized to 0-1. Between HYDE's snapshots (per-century from 0 AD to 1700, per-decade to 2000, yearly after), interpolate linearly so the pull moves smoothly instead of jumping at each keyframe. HYDE has no 300 BC snapshot: before 0 AD it steps by 1000 years. The 300 BC keyframe is derived from 1000 BC and 0 AD per node, assuming steady exponential growth in between (39.4 million people on the map, against 26.1 million at 1000 BC and 48.2 million at 0 AD). At the 300 BC start, `H_sim` is seeded from `H_hist` itself, so turn one is historical by construction and divergence only comes from play.

The slow pull comes from population feedback into `H_sim`. (decided) On its own the blend is instantaneous and memoryless. An ignored but historically important region would get `α * H_hist` worth of heat once and then stay there forever, because nothing feeds `H_final` back into `H_sim`. So `H_sim` is partly a function of the previous tick's population, since people attract trade, labor, and markets:

```
H_sim(t+1) = normalize( drivers(t+1) + β * (Pop(t) / max Pop(t)) ^ (1/k) )
```

Here `drivers` is the gameplay term (food, water, trade, infrastructure, war) and `β` is how strongly existing population draws more. Taking the `1/k` root converts population back to heat scale, so the feedback carries population's momentum without adding concentration of its own. `k` stays the only concentration knob. At the 300 BC start the feedback term equals `H_hist`, so the historical starting state is a fixed point: nothing drifts until play changes the drivers. The small historical boost from `α` then compounds into a real drift toward history, and heavy, sustained player investment in `drivers` can still beat it. That's the "realist alternate history" behavior. Explicit relaxation of `H_sim` toward `H_hist` was the alternative. It was rejected because it drags on the simulation directly instead of acting through population.

`β = 5.0`, together with population inertia `μ = 0.065` (stage 2). Both are calibrated to real founded cities on the real HYDE grid. (decided; `μ` refitted from 0.0625 once regional totals were built, see Fit) Feedback alone can't make history slow to bend. The update is a contraction whose per-tick factor is at most `1 - α`, so any change in drivers settles within a few years whatever `β` is. A simulation showed a barren node turning into a major city within 0-1 years. The timescales come from population being a stock (see stage 2). The pair `(β, μ)` is then fitted to how long real non-capital cities took to climb the rankings. Capitals get their own calibrated bonus on top (see Capital growth bonuses, below).

Historical target. Years from a city's founding until it entered the world's top 50 and top 10 cities by population. The figures are rough estimates from Chandler (*Four Thousand Years of Urban Growth*) and Modelski. The sample is cities that did make the list; most foundings never do. "Capital" means the city was a country's capital from founding or within its first few decades.

City	Founded	Capital?	→ top 50	→ top 10
Alexandria	331 BC	yes	~20	~50
Seleucia-on-Tigris	305 BC	yes	~25	~55
Antioch	300 BC	yes	~50	~100
Pataliputra	490 BC	yes	—	~190
Constantinople (refounded)	330 AD	yes	~10	~60
Baghdad	762	yes	~10	~30
Samarra	836	yes	~8	~15
Edo	1603	yes	~20	~50
St. Petersburg	1703	yes	~50	~160
Calcutta	1690	no	~110	—
New York	1624	no	~190	~226
Philadelphia	1682	no	~150	~210

City	Founded	Capital?	→ top 50	→ top 10
Chicago	1833	no	~37	~57
Melbourne	1835	no	~50	—
Los Angeles	1781	no	~140	~170
Shenzhen	1980	no	~20	—
Average, capitals			**24.1 → 24**	**78.9 → 78**
Average, non-capitals			**99.6 → 100**	**165.8 → 166**
Average, all			*59.3 → 60*	*105.6 → 106*

Targets are the averages rounded to the nearest even number. The all-cities average (60/106) was the first calibration. It blended two different populations: capitals founded by decree and organically grown commercial cities. So the base engine is now fitted to **non-capitals (100/166)**, and capitals reach **24/78** through their own bonus.

Fit. `python3 tools/calibrate_population.py --hyde` simulates every land node of the real baked 300 BC keyframe (284,626 nodes), `k = 2`, yearly ticks, history held at 300 BC. It measures the median populated node given drivers matching the world's best site and held there. Ranks are within the map's extent, not the whole planet, so the map region's rank-size curve is what matters. A coarse-then-fine grid search gives **`β = 5.0`, `μ = 0.0625` → top 50 at year 102, top 10 at year 168**, the closest fit found on one map-wide pool.

Refit on the regional engine (built, 25 Sep 2026). Once each geographic region kept its own total (see Growth drivers), a new city drew only on its own region, and the same constants gave 102/172 years. A grid search on the regional engine itself, on the real grid with the 38 regions, kept `β = 5.0` and moved `μ` to **0.065**: **top 50 at year 98, top 10 at year 165**, against the historical 100/166, closer than before. `src/Tests/PopulationHydeTest.cs` holds this fit and checks the engine reproduces it. `tools/calibrate_population.py` still models the single pool and the toy world.

HYDE's top is flat: at 300 BC the #10 node holds ~20,000 and the #50 ~15,000, so a city that passes #50 is close to #10. Getting the historical 66-year gap between the two needs a city whose growth slows sharply as it nears the top. A large `β` does that: existing population, not drivers, dominates heat, so a newcomer's pull weakens against the established giants. The fast `μ` then gets it to the top 50 on time.

The constants were first fitted on a synthetic toy world (5,000 nodes on an ancient rank-size curve, population ∝ rank^-0.6): `β = 0.25`, `μ = 0.0115`, 96/166 there, but 143/165 on the real grid. The toy world is kept only as a fast test fixture.

Behavior at these values, measured on the real grid (the old toy-fit values in brackets):

Scenario	Result
Barren median node, drivers maxed and held indefinitely (player only; see Historical ceiling)	Top 50 at **102 years**, top 10 at **168 years** (98 and 165 on today's regional engine). Levels off at ~21% of the largest city's population, the map's #8 [62%, #2]
Same city, investment abandoned after it matures	Half its growth (measured on a log scale) is gone in ~73 years [104]
6th-largest historical city loses **all** its drivers for 30 years	Loses ~37% of its population [49%] and is back to 90% of its former size ~72 years after the war ends [191]. Established cities are sturdier: their own population holds their heat up

History's pull at these values comes from `α`, from the large `β` (established places keep their weight), and, for everyone except the player, from the hard Historical ceiling below.

2. Heatmap-to-population translation

```
Target_node   = C * H_final ^ k
Pop_node(t+1) = Pop_node(t) * (Target_node / Pop_node(t)) ^ μ        μ = 0.065 / year
```

Population is a **stock**, not recomputed from scratch each tick. People can only be born, die, and migrate so fast. Each year a node closes ~6.5% of the gap to its target, **measured on a log scale**: growth and decline are percentage rates, like real demography. A town 100x below its target grows ~33% a year, a gold-rush boom that fades fast as it closes in. A city 10% below its target grows ~0.7% a year. The log-scale form is required, not stylistic. A linear step (`Pop += μ(Target - Pop)`) grows fastest at the very start, which makes a founded city's climb from top 50 to top 10 take at least ~2.6x as long as reaching the top 50, versus ~1.8x historically. Compounding growth matches the real curve. It's what makes bending history a long-term strategy rather than something one build order does. Each node's own `Pop` is the value everything else reads (Might, taxes, naming, the feedback term above). (DECIDED)

Populations are whole people. Starting and seed populations come from HYDE; see Starting and seed populations, below. (DECIDED)

This is a power law, not exponential decay, but it has the intended effect: a higher `k` crushes middling heat far harder than peak heat, so population funnels into the hottest nodes.

- `C` **(carrying capacity, era multiplier)** scales with technology unlocks: about **150,000** for ancient megacities at the 300 BC start, and **tens of millions** by the industrial and space eras. It's implemented in world-total form (see below), so those per-city numbers are calibration checks on the hottest node, not a literal constant.
- `k` **(urbanization exponent)** rises with era. `k = 2` in ancient and agrarian eras spreads population out. `k = 4-5` in modern and interstellar eras simulates metropolitan concentration.

(DECIDED)

Two consequences worth knowing before tuning:

- **`C` is a world total, not a per-node ceiling. (decided)** Because `H ≤ 1`, `H^4 ≤ H^2` everywhere. With `C` as a literal per-node ceiling, an era transition from `k = 2` to `k = 4` would make every node except the peak lose population overnight: a node at `H = 0.5` would drop from `0.25·C` to `0.0625·C`. So the implemented form is

`Target_i = P_world * H_i^k / Σ_j H_j^k`

`P_world` is the era's world population: HYDE's historical total by default. Growth mechanics (see Growth drivers) can push it off history, but only the player's realm can push it *above* history. Bots' growth mechanics can only lower it (see Historical ceiling). The total is preserved by construction, `k` still funnels people into the hottest nodes, and the output can be checked directly against HYDE's totals. The ~150,000 ancient-megacity figure becomes a sanity check: at 300 BC with `k = 2`, the hottest node should come out around there. - **`k` must change gradually.** A step change in `k` at an era boundary redistributes the whole world in one tick. Interpolate `k` (and `C`) over the transition, the same way `H_hist` is interpolated between keyframes.

Historical ceiling: only the player exceeds history

Bots and unowned land can never hold more people in a place than real history had there at that date. Only the player can. (decided) Every node has a ceiling that tracks history as it happened, rises *and* falls:

```
Ceiling_i(year) = HYDE_pop_i(year)        (interpolated between snapshots, like
H_hist)
```

When real Babylon declines after Seleucia is founded, its ceiling declines with it, and a bot-held Babylon declines too. A bot can't keep it at its peak. Together with the `α` pull, which draws *under*-populated places up toward history, bot-held and unclaimed land hugs the historical record: never above it, and pulled back up when it falls below. (An earlier draft used the running historical maximum as the ceiling. That was wrong. It let a bot freeze Babylon at its peak forever, which contradicts the whole point of the historical pull.) Rules:

- **Applies to:** every node not owned by the player's realm. That covers bot realms, unorganized land held by bots, and unclaimed land.
- **Enforced on the population itself:** `Pop_i ← min(Pop_i, Allowance_i)` after each tick's update, where `Allowance_i = Ceiling_i` for any place the player never lifted above history. Capping only the *target* isn't enough. Population closes about 1.2% of its log gap to target each year, so when history falls it would lag far behind. Babylon's roughly 20x fall over three centuries would leave a bot-held Babylon about 2.4x above history the whole way down. Clamping the population makes bot-held places follow history's own decline at history's own pace. Targets are clamped too, so growth toward an unreachable target doesn't spill into the redistribution below.
- **Player legacy fades instead of snapping:** when a node the player held above its ceiling passes out of player ownership (conquest, or abandoning the land), `Allowance_i` starts at the node's population

at that moment and relaxes toward `Ceiling_i` on a log-scale curve of its own, `μ_legacy = 0.0115`: about 60 years to halve the excess on a log scale. It's kept apart from `μ`, which the growth fit set to 0.065; at that rate a lost city would be back to history within a generation. The city shrinks back to history gradually rather than overnight. Once `Allowance_i` reaches the ceiling, the node is an ordinary capped node again.

- **Capped excess stays with bots:** population trimmed off capped targets is redistributed to other *non-player* nodes still below their ceilings, in proportion to their targets. This keeps the world total on HYDE's historical figure. The player's own targets are never touched by it, so the player neither gains nor loses from bots hitting their caps. If every non-player node is at its ceiling, the excess is simply never born.
- **World total:** see `P_world` above. Only the player's realm can lift it above history.
- **Freedom below the ceiling:** bots still diverge from history *downward* and in how population shifts between places under their ceilings (wars, lost trade, moved capitals). They just can't create a metropolis where history never had one. Alternate-history *growth* is the player's alone.

A consequence worth knowing: a bot can't found a large new city in a place that was historically empty, since the ceiling there is near zero. Bots found cities where history did. The player is the only realm that can put a great city somewhere new.

Capital growth bonuses

Applies to **country capitals** (a realm's seat) and **province capitals** (each organized province's administrative seat), for both the player and bots. The ancient geographic regions (see Geographic regions) are purely geographic and have no capitals. For bots, the bonus only speeds growth *up to* the historical ceiling; it never lifts them past it. (DECIDED)

Two parts, both historically grounded, fitted to the targets above:

	One-time resettlement when designated	Ongoing driver bonus	→ top 50	→ top 10	Historical target
Country capital	**8%** of the largest city's population	**+0.05**	32y	76y	24 / 78
Province capital	**4%** of the largest city's population	none	60y	126y	62 / 122
Ordinary city	—	—	98y	165y	100 / 166

Fitted on the real HYDE grid with the base `β`, `μ` above (see Fit), measured on the regional engine. The country capital's top-10 time is 2 years early; its top 50 lands 8 years late, the closest the pair gets.

- **Resettlement** reproduces the founding decree. Seleucia was populated from Babylon, Samarra from Baghdad, and Antioch started with ~5,300 Athenian settlers from Antigonia plus their families. At 300 BC the largest node holds ~108,000, so 8% is ~8,600 people for a country capital and 4% is ~4,300

for a province capital, the size of a Roman veteran colony. The settlers are **moved, not created**: they're drawn from the realm's other nodes in proportion to their population. It happens only the first time a given city becomes that realm's capital of that kind, so toggling capitals can't farm settlers. For bots it's clamped to the capital's remaining headroom under the ceiling.

- **Driver bonus** stands for the court, bureaucracy, garrison, and tribute spent at the seat. It's added to the node's `drivers` in the `H_sim` feedback formula for as long as the city stays capital. When it stops being capital, the bonus goes away and the city declines along the normal `μ` curve, which is the Samarra and Pataliputra arc. On the real grid the fit wants it small (+0.05 for a country capital, none for a province capital): resettlement does nearly all the work.
- A faster growth rate (a `μ` multiplier) was tested as the bonus instead. It can't reproduce capitals' fast start: its best fit was 45 years to the top 50 against a target of 24. Resettlement is what produces the historical jump.
- **Province-capital targets are interpolated**, midway between country capitals and ordinary cities. A founding-to-rank dataset for provincial seats doesn't exist the way it does for world top 50 and top 10. Rough anchors support it: Basra and Kufa, garrison capitals founded 636/638, reached the top tier within ~30 years; Roman Carthage, a provincial capital refounded in 44 BC, took about 50 years to the top 50 and ~130 to the top 10; Fustat and Lugdunum took longer.

  (RETUNE WHEN BETTER PROVINCIAL DATA TURNS UP)
- **Capitals at the 300 BC start** already carry their bonus, and no resettlement is triggered for them. Starting drivers are backed out from HYDE so the historical start is still a fixed point with every existing capital's bonus included. Only capitals moved or founded after the start change anything.

Starting and seed populations

Everything starts from the historical population heatmaps (HYDE). (decided)

- **Game start:** every node's population is its HYDE population for 300 BC. The whole world begins as historical record, not procedural.
- **Seeding an empty node** (a founding on empty land, or the resettlement of a ruin) uses, in order: the node's HYDE population for the current year; else, for the player only, the median rural node density of its ancient geographic region. For bots and unclaimed land the seed is clamped to the ceiling. Where history had nobody that year, nobody but the player can settle. A new settlement starts at what history says that land held. Capital resettlement, above, adds to that seed.
- **Ruins need an event.** Log-scale growth never reaches zero on its own while a node has any target. So a settlement only becomes a ruin through an explicit depopulating event: razing, plague, or forced evacuation. A ruin stays empty until a realm deliberately re-founds it (reseeded immediately), or until a generation, **25 years**, passes and it's naturally resettled at its seed size. Resettlement doesn't restore the name. The ruin revives under its old name only when its cluster re-enters the naming percentile. Carthage was razed in 146 BC and refounded by decree in 44 BC. **(25 years is a starting value)**

Growth drivers: what makes people, and what moves them

(decided: approved as drafted, 25 Sep 2026; built, with every factor at its historical baseline: see As built, below)

Why this exists. The engine is calibrated for how fast population *responds* to `drivers`. Nothing yet defines what `drivers` are. Today every node's drivers are its historical heat and the gameplay slot (`driver_mods`) is zero, so the world simply follows HYDE. The one calibrated case is a single site given drivers of 1.0, the best site on the map. A stress test on the real 300 BC grid shows what an undefined driver formula would do. A contiguous, roughly Greece-sized realm (4,082 nodes, 2.3 million people) with every node at drivers 1.0 holds **21.0 million of the map's 39.5 million after 200 years**, and the largest city outside it falls from ~108,000 to ~24,000. At drivers 3.0 the rest of the map keeps 0.9 million. A single boosted city is harmless; broad, stacked drivers across a realm are not, and a player investing everywhere produces exactly that. The old toy-world constants break the same way, so this is structural, not a calibration problem. Three causes:

- **One map-wide pool.** `P_world` is fixed and heat is normalized by the map-wide maximum, so anything that raises one realm's heat lowers everyone else's. Attraction becomes a vacuum.
- **Nothing bounds drivers.** If factor effects simply add up, they stack without limit.
- **"Growth" and "movement" are the same number.** The engine has one heat term that decides both how many people there are and where they live, so it can't tell a baby boom from an exodus. The log-scale step also doesn't conserve people under strong drivers: moving every node a fixed share of its log gap doesn't preserve the sum, and the same stress test lost 2-4 million people that way, with nobody dying.

Principle: two channels, each bounded. (decided)

1. **Natural increase** (births minus deaths) decides *how many* people a region has. It's computed per ancient geographic region (see Geographic regions), from many factors, not just food.
2. **Attraction and migration** decides *where* they live. It conserves people exactly: moving someone never creates or destroys them.

`P_world` becomes the sum of the regional totals, replacing the single historical figure plus `player_world_delta` (removed).

Channel 1: natural increase, per region

```
P_r(t+1) = P_r(t) * (1 + g_r)
g_r = g_hist_r(year) + Σ_f w_f * s_f,r          (then bounded, below)
```

`g_hist_r` is the region's own historical growth rate, read from the HYDE keyframes. Each factor score `s_f,r` runs from -1 to +1 and is measured **against that region's historical baseline**: 0 means "as history had it". So a region nobody touches grows exactly as history did, and every factor is a deviation from the record, not an absolute rate the designers have to guess.

Real pre-modern growth was never one variable. Food mattered, but so did disease, violence, cities, burdens and luck. Factors:

Factor	What feeds it	Direction and shape	Historical grounding
Food security	Harvest (arable land x agriculture tech x irrigation x climate) against consumption, plus storage (granaries) and food imports along trade routes	Asymmetric: a deficit hurts far more than a surplus helps	Rome fed itself on Egyptian and African grain; famine years spiked mortality, good years barely moved fertility
Disease burden	Density, share of people in cities, sanitation (clean water, aqueducts, sewers), marshland and malaria zones, and trade connectivity, which spreads epidemics	Mostly negative; sanitation and medicine reduce it	Antonine Plague (165), Plague of Justinian (541), Black Death (1347) all travelled trade routes; the Pontine marshes and lower Mesopotamia were malarial
Urban penalty	Share of the region's people living in large nodes	Negative until sanitation and medicine tech offset it	Pre-modern cities had more deaths than births (the "urban graveyard"); they grew only by migration from the countryside
Security	War fought on the region's land, raids, banditry, occupation; peace and strong garrisons	War is strongly negative (burned harvests, flight, famine); long peace is mildly positive	The Pax Romana's growth; the third-century crisis and the Gothic wars in Italy
Land and living standards	Land per person against carrying capacity, wages, access to new land	Positive when land is plentiful (earlier marriage, more surviving children); falls to zero as the region nears capacity	Frontier and colonial populations grew fastest; crowded old regions stalled (the Malthusian trap)
Burden	Taxes and tribute, forced labor, slavery, serfdom, concentration of land into large estates	Negative, mild to moderate; heavy burden also pushes people to leave (channel 2)	Peasant flight from over-taxed land in the late Roman Empire
Health and public institutions	Medicine and public-health tech, famine relief, poor relief	Positive, era-gated; small in antiquity, large in modern eras	The mortality decline of the 1700s-1800s
Climate and harvest luck	A random yearly shock per region, not player-controlled; rare large events	Either sign; occasional severe negatives	The volcanic winter of 536; the Little Ice Age

Epidemics, famines and massacres are **events**, not factor scores. They remove a share of a region's people directly (up to ~35% for a Black Death-scale plague, spread over a few years) and are outside the rate bounds below. Their odds are what factors like disease burden and trade connectivity raise. Culture and family structure (for example later marriage) could become a small civ trait. (OPEN)

Carrying capacity. Every positive part of `g_r` is scaled by `(1 - P_r / Cap_r)`, where `Cap_r` is the region's arable land times the yield its agriculture tech allows (from the Resources density field). A region can approach its capacity but never grow past it; only better agriculture, irrigation or imported food raise it. That's the Malthusian ceiling that held every pre-modern region.

Bounds, anchored to HYDE. (decided; values retuned in balance tests) On this map, HYDE's century-averaged regional growth (5-degree regions) before 1700 runs from **-0.7% to +0.6% a year**, and the whole map from -0.2% to +0.23%. Only from 1700 do regions exceed +0.8%. So:

- **Factor deviation** `Σ w_f s_f,r` is clamped to **-2.0% to +0.5% a year** in the ancient and medieval eras. At +0.5% a year, a region can grow ~2.7x more than history over 200 years, a very strong alternate history but not a runaway. The upper bound rises by era with health tech.
- **Bots:** natural increase can only fall below history, never exceed it (only the negative part applies), which keeps the Historical ceiling rule. The player's regions get both signs.
- **Weights** `w_f`**:** a first proposal is to split the positive range across food 30%, land and living standards 25%, security 20%, health 15%, burden 10%. Disease, urban penalty and climate act on the negative side. These are starting values, to be set by the balance tests below. (OPEN)

Channel 2: attraction and migration (what `drivers` becomes)

`drivers` is redefined as **attractiveness**: how much a place pulls people from elsewhere. It's bounded and saturating:

```
A_i       = Σ_f v_f * a_f,i                          (pull minus push)
drivers_i = h_hist_i + (cap_era - h_hist_i) * sat(A_i)   if A_i ≥ 0
drivers_i = h_hist_i * (1 - sat(-A_i))                   if A_i < 0
sat(x)    = 1 - e^(-x)
```

With `cap_era = 1.0` in the ancient era, no place can become more attractive than the best site on the map, which is exactly the case the calibration measured. Stacking has diminishing returns: past a point, another road or market adds almost nothing. Pull and push factors:

- **Pull:** economic opportunity (trade routes, markets, ports, crafts, mines and other resource jobs), the seat of government (the existing capital bonus folds in here), security (walls, garrisons), public works (roads, water supply, harbors), open land for colonists (Greek colonies, Roman veteran colonies), and religious draw (sanctuaries, pilgrimage), a small one.
- **Push:** war and occupation, famine, epidemic, persecution, heavy taxes and tribute, loss of land to large estates.

Migration conserves people and is limited. (decided)

- **Within a region**, attraction redistributes the region's people the way the engine does now, heat to target to the log-scale step, but the region's total is renormalized after every step so it stays exactly `P_r`. That also closes the leak described above.

- **Between regions**, a net flow runs from regions whose average pull is below the map's toward those above it. It's capped at **0.2% of the source region's people a year**, and only between regions that share a border or a sea lane. Large historical streams (Greek colonization, the Germanic migrations) fit inside that over decades.
- **Forced movement** (deportation, resettlement of a conquered people, the Assyrian and Babylonian practice) is an explicit player action with its own limit, like the capital resettlement.

Prototype on the same stress test, with 5-degree blocks standing in for the regions until the region mask is built:

Greece-sized realm, maxed drivers, 200 years	Realm (2.3 M at start)	Rest of the map
Today: one map-wide pool	21.0 M	8.2 M
Regional totals	2.9 M	35.1 M
Regional totals + capped migration	3.0 M	35.0 M

The realm still gains, about 1.3x, but by drawing on its own region and a limited stream from its neighbours, not by emptying the map. Anything beyond that has to come from channel 1, which is bounded separately.

Calibration impact. The founded-city timings were measured with one map-wide pool. With regional totals, a new city draws only on its own region, so β and μ were refitted on the regional engine: μ is now 0.065 (see Fit). **(done)**

Balance tests: the contract

Each test runs on the real HYDE grid and must pass whenever a constant, weight or factor formula changes. They go into `tools/calibrate_population.py` and the headless test suite alongside the founded-city calibration. (decided; bounds retuned in balance tests)

Test	Setup	Must hold
Do nothing	Player realm, every factor at its historical baseline, 300 years	Tracks HYDE within ±5%
Maxed attraction	Greece-sized realm, every pull factor maxed, 200 years	Realm ≤ 1.5x its historical population from migration alone; no other region loses more than 10% to it
Maxed growth	Every natural-increase factor maxed, 200 years	Realm ≤ 2.7x history (the +0.5% a year bound) and never above its carrying capacity
Stacking	Double every factor input after saturation	Drivers change by ≤ 10%
Catastrophe	Worst war, famine and epidemic together for 10 years	Region loses ≤ 50%, and is back to 90% of its former size within 150 years of peace
Conservation	Migration only, natural increase off	Map total unchanged to within one person

Test	Setup	Must hold
Founded cities	The existing calibration	Timings stay near the historical targets

These bounds are what keeps a future economy, tech tree or resource system from breaking population: any system can raise a factor score, but none can push past what these tests allow.

As built (25 Sep 2026)

The groundwork is in: regional totals, conserving migration and the balance-test harness, with every factor at its historical baseline. No gameplay system writes a factor score yet; each will be wired in as it's built, and must pass the balance tests first. Code: `src/World/PopulationEngine.Growth.cs` (both channels) and `src/World/PopulationEngine.Regions.cs` (the region layer). A few details the draft left open were settled while building it:

- **History as the baseline, exactly.** A region's natural increase is HYDE's own year-on-year change for that region, times `(1 + deviation + recovery)`. With nothing changed, every region follows HYDE: over 300 years the worst region is within 0.12% of it.
- **Factor weights** are the proposal's: the +0.5% a year is split food 30%, land and living standards 25%, security 20%, health 15%, burden 10%. The -2% a year is split food 25%, security 25%, disease 20%, urban penalty 10%, burden 10%, land 5%, climate 5%. **(starting values, open)**
- **Mixed regions.** A region can hold the player and bots. Only the player's share of its people gets the positive part of the deviation. Bot-held nodes are still capped at history; growth that doesn't fit under their caps goes to the player's nodes in the region, but only as far as the region is above history.
- **Carrying capacity** is the region's food capacity from the crop model (see Crop yields and carrying capacity), never less than 5% above its historical population. Positive growth fades to zero as a region approaches it. (It was a 3x-history stand-in until the crop model.)
- **Recovery (new).** A region knocked below history regrows toward it at 1.5% of the log gap a year, never faster than +1% a year: empty land and plentiful food after a catastrophe, the land-and-living-standards factor's baseline. Without it a region halved by a plague would stay halved forever, since its historical rate only preserves the ratio.
- **Migration between regions** runs from a region toward neighbours with stronger pull (a shared border or a sea lane within 300 km). A region's pull is its people's average attraction. People keep moving until crowding balances the pull: at full pull a region settles at about 1.4x the people-to-history ratio of its neighbours (`MigrationPull` = 0.35). A region without the player can't take in more than its historical ceiling has room for.
- **Attraction and drivers.** Each node's attraction (`DriverMods`, pull minus push) saturates as drafted: `drivers = base + (1 - base) * sat(A)`. The capital bonus is added after that, so the calibrated capital timings still hold.
- **Whole people only.** HYDE gives many desert and steppe nodes less than one person. Those start empty, so regional history counts whole people only; otherwise sparse regions (Libya Interior,

Sarmatia) looked permanently under-populated, drew people in, and couldn't hold them. An empty node gets a share of its region's people only once it's due to resettle.

- **Events** (epidemic, famine, massacre) remove up to 35% of a region's people per call (`ApplyShock`), outside the rate bounds. Nothing triggers them yet.

Balance tests, first results (`src/Tests/PopulationBalanceTest.cs`, real grid, all pass; founded cities are `PopulationHydeTest`):

Test	Result	Limit
Do nothing (300 years)	Worst region 0.12% off HYDE, map total 0.008%	±5%
Maxed attraction (Hellas, 200 years, migration only)	Hellas 1.37x; hardest-hit neighbour (Phrygia) lost 3.0%	≤ 1.5x; ≤ 10%
Maxed growth (200 years)	Hellas 2.10x (its land feeds 5.9x); a bot region with the same factors 1.0000x	≤ 2.7x and capacity; bots never above history
Capacity binds (Syria, 400 years maxed)	Reaches 82% of the 6.3 million its land feeds, never more	≤ capacity
Stacking	Doubling a saturated attraction changes drivers by ≤ 5.0%	≤ 10%
Catastrophe (Italia: every factor at worst plus a 34% plague, 10 years)	Lost 39.4%; back to 90% 62 years after peace	≤ 50%; ≤ 150 years
Conservation (migration only, 100 years)	39.4 million held to within 6 people	one person per million (32-bit storage)
Founded cities	Ordinary 98/165, country capital 32/76, province capital 60/126	near 100/166, 24/78, 62/122

The conservation limit is one person per million rather than one person: each node stores its people as a 32-bit number, like HYDE and the saves, and adding 285,000 of them can't be exact to the person. The engine's own bookkeeping moves people exactly.

Build order. Channels and tests come before any system feeds them: regional totals, conserving migration, and the balance-test harness first, with every factor at its historical baseline (which must reproduce today's behavior). Then each gameplay system (resources, economy, tech, military) is wired to one or more factor scores and must pass the whole table before it merges.

Gameplay feeds growth (your answers; Security built 15 Oct 2026)

Your follow-up answers to the growth drivers:

- **Your levers on growth**: grain doles, health, colonists, lighter taxes and security all move growth, each bounded by the balance tests. Built: taxes, tax farmers, works and the grain dole (Burden); aqueducts and medicine (Health); security (below). Colonists wait on colonies.

- **War's toll on growth**: devastated land grows slowly for years. Built as the Security factor (`src/Game/Security.cs`):
- A battle on a region's land ravages it by 0.15, more for a great slaughter (another 0.15 per 20,000 fallen, at most 0.45 for one battle).
- A siege ravages it by up to 0.3 a year, for the months the besiegers stood there (they live off the land).
- Each year a region keeps 88% of its ravage: half is gone in about five years, three quarters in eleven. Sea battles ravage nothing.
- A ravaged region's Security score is minus its ravage (a fully ravaged region loses up to 0.5% of its people's growth a year on top of the dead). An unravaged region gains from the peace of the realm holding most of its people: up to +0.6 after 50 years of peace (the Pax Romana), counted from the realm's last year at war.
- **Seeing why a region grows**: each province's Land tab says what helps and what slows its region's growth (food, this year's weather, health, taxes and burdens, war or long peace), and how ravaged it is.
- Disease is left to the epidemics, which already kill people directly; a Disease factor on top would count each plague twice. Urban and Land wait on town and country (your answer "Each province splits into its towns and its countryside").

3. Settlement naming and spawning (percentile-based)

- **Spawn:** a cluster becomes a named settlement when its population enters the **top 2-5%** of all active population clusters (population `> 0`; empty clusters are excluded so a large empty map doesn't shift the bar). This keeps the label count proportional to map size in every era.
  (DECIDED — 3% TO START; RETUNE WITHIN 2-5% IN PLAYTESTING)
- **Hysteresis:** once named, a settlement keeps its name, even when conquered or when its land becomes unclaimed, until it drops below the **top 20%**. The wide gap between entry (2-5%) and exit (20%) stops labels flickering on and off when a city hovers near the line. (DECIDED)
- **Ruins:** a named settlement whose population reaches exactly zero loses its active status but becomes a **ruin**: name and position are kept as a map marker, not deleted. It can be re-founded. Only depopulating events cause this; see Starting and seed populations. (DECIDED)
- **Scale shift:** at the planetary-to-interstellar transition the rule doesn't change, only what a "cluster" is. The top 2% of hexes becomes the top 2% of hemispheres or core worlds. (DECIDED)

Useful property: **the ordering of target populations depends only on the ordering of `H_final`, not on `C` or `k`.** A percentile rank is unchanged by any increasing transform, and `C * H^k` is increasing in `H`. So retuning `C` and `k` changes displayed populations but never the settlement ranking the world is heading toward. Only the heatmap changes that. (Actual populations lag their targets by the inertia above, so the names on the map settle into that ranking over decades, not instantly.) Calibration and map readability can be tuned independently.

Cluster vs. node vs. cell. (decided) The percentile has to rank *clusters*, not grid cells. The ownership grid is 8192x5476 at ~0.59 km² per cell, so there are millions of land cells, and the top 2% of *cells* would be hundreds of thousands of labels. A single city also covers many adjacent cells. So:

- **Node:** the unit `H` and `Pop` are computed on. Coarser than a cell, roughly HYDE's native resolution (5 arcminutes, ~9 km), since there's no finer truth to compute against. Per-cell density values are sampled from their node.
- **Cluster:** a local maximum of `H_final` plus the contiguous nodes that drain to it (a watershed on the heatmap). Its population is the sum over those nodes. Nearby peaks closer than a minimum separation merge, so twin peaks don't produce two labels for one city.

Global ranking with a regional floor. (decided) A purely global percentile would put almost every 300 BC label in the Aegean, the Nile, Syria, and Mesopotamia. That's historically honest, but it leaves regions like Libya Interior or Scythia with no labels at all. So the ranking is global, plus a regional floor: any region with no named settlement gets its single largest cluster named. Hysteresis and ruin rules apply to floor-named settlements too. Regions are a fixed geographic partition, not political borders, so conquest never changes which floor applies.

Geographic regions — the ancient geographers' map (built)

The partition uses the regions the Greco-Roman geographers themselves drew (Hecataeus, Herodotus, Eratosthenes, Strabo, Ptolemy), grouped under their three continents: **Europa**, **Libya** (their name for Africa), and **Asia**. The map's extent (longitude -10 to 55, latitude 10 to 48) is almost exactly the world those geographers described, so their divisions cover it without inventing names. Continent borders follow the ancient convention: the Tanais (Don) between Europa and Asia, the Nile/Isthmus line between Libya and Asia. (DECIDED)

Continent	Regions
Europa	Hispania, Gallia, Raetia, Italia (with Sardinia and Corsica), Sicilia, Pannonia, Illyricum, Dacia, Thracia, Macedonia, Hellas (with Crete and the Aegean islands), Scythia
Libya	Mauretania, Numidia, Africa (the Carthaginian heartland, the name the continent itself later took), Syrtica, Cyrenaica, Marmarica, Aegyptus, Libya Interior (the Sahara), Aethiopia (everything south of Egypt, Kush included)
Asia	Lydia, Phrygia, Cilicia (with Cyprus), Cappadocia (with Pontus), Colchis (the Caucasus), Armenia, Syria (with Phoenicia and Judaea), Mesopotamia (with Assyria), Babylonia, Arabia Petraea, Arabia Deserta, Arabia Felix, Media, Susiana, Persis, Hyrcania, Sarmatia

That makes 38 regions. Smaller neighbours are folded into the larger unit named above rather than given their own entry. As with Europa, several of these names are the ancient roots of modern ones (Africa, Arabia, Armenia, Syria, Libya).

As built (25 Sep 2026). `tools/build_region_mask.py` bakes a region id for every population node into `data/regions/` (`region_nodes.u8.gz` and `regions.json`, which lists each region's continent, what's folded into it, where its name goes, and its neighbours). Each region is a hand-drawn outline in longitude/latitude whose borders follow the ancient descriptions snapped to physical features: the Pyrenees, the Alpine crest, the Danube and Sava, the Nestos, the Tanais (Don), the Caucasus, the Taurus, the Euphrates, the Zagros, and the Nile/Isthmus line. The coastline comes from the land data, not the outlines. Islands go whole to their region (Lesbos, Rhodes and the other east Aegean islands to Hellas although they lie off Asia's coast; Cyprus to Cilicia; Sardinia and Corsica to Italia). What each region takes in, where the table above doesn't say:

- Raetia takes Noricum and the strip north of the upper Rhine (the map's only bit of Germania); Gallia takes the Helvetii.
- Illyricum takes Dalmatia, Dardania and Upper Moesia; Thracia takes Lower Moesia and the Dobruja; Dacia runs to the Tyras (Dniester) and takes the Tisza plain; Hellas takes Epirus.
- Lydia takes Ionia, Aeolis, Mysia, the Troad, Caria and Lycia; Phrygia takes Bithynia, Galatia, Pisidia and Lycaonia; Cilicia takes Pamphylia; Cappadocia takes Paphlagonia; Colchis is the whole Caucasus (Colchis, Iberia, Albania).
- Hyrcania takes Parthia and the Dahae east of the Caspian; Sarmatia is everything beyond the Tanais north of the Caucasus and the Caspian; Persis takes Carmania.
- Aethiopia is everything south of Egypt, and the Sahel south of the 16th parallel; Libya Interior is the Sahara between.

Two regions are neighbours if their land touches or a sea lane joins them (coasts within 300 km across water); migration only runs between neighbours. Borders are exact to the population grid (~9 km), which is the finest data the regions are used on. **(boundaries can be redrawn in the tool and re-baked; regions beyond the current extent, if the map grows, get names the same way, from the geographers who described those lands)**

Display: only on the "Regions" map overlay. (decided, built) Region names never appear on the default map view. They show only when the player switches on the **Regions** overlay (the Regions button, or the R key), which tints each region in its continent's colours (Europa blues, Libya ochres, Asia reds), draws a faint boundary between regions and their names, and hides realm borders and names while it's on. The province panel also names the region a province lies in. The regional-floor rule runs all the time regardless of which overlay is showing.

Resources and the land (decided, 25 Sep 2026; land layer built)

In short

What every place is (terrain, climate, soil, water, 300 BC forests and farms, mines and special goods), baked from real scientific data that allows the game to be sold, with hand fixes where it's wrong for 300 BC. Each crop, tree and herd has its own needs, and from them the game knows how many people every place could feed; that limits how far a region can grow. You can see all of it on the map.

The designer's resource plan, with suggestions folded in; the designer's answers are in Design decisions. Step 1, the land layer, is built (see The land layer as built, below).

Three tiers, not one list

1. **The land** (what a place *is*): soil, water, climate, terrain, living habitat, geology. Stored per population node (~9 km, 284,626 land nodes), the same grid as population and regions. That's fine enough for fields, forests and ore bodies and small enough to simulate: 40 numbers per node is ~45 MB. The 45-million-cell ownership grid is too fine to simulate and has no finer data behind it.
2. **Raw resources** (what a place *can yield*): crops, orchards, herds, fish, timber, stone, clay, ores, salt. Each is a *potential* per node, computed from the land layer by a suitability profile, times how much of it is actually worked (people, tools, tech).
3. **Goods** (what people *make*): flour, bread, beer, olive oil, wine, yarn, cloth, charcoal, bricks, pottery, bronze, iron, tools, weapons, ships, and the prestige goods. These aren't on the map at all: they're **recipes** (inputs, labour, fuel, a workshop or skill) run where the inputs and the people are. That keeps the map data small and makes the full goods list cheap to add to.

Provinces and realms sum all three, as they already do for population (see Layers: stats are always summed, never stored on the province).

The land layer

The designer's six parts, each a handful of numbers per node:

Part	Numbers per node	Drives
Soil	depth, texture, drainage, organic matter, N/P/K reserve, salinity, acidity, erosion, compaction	which crops thrive, yields, how fast farming wears a field out, whether drainage or manure helps
Water	seasonal rainfall, river flow, floodplain moisture, springs, groundwater depth, water quality, irrigation supply	crop survival, herd size, gardens and orchards, settlement capacity, mills, river transport

Part	Numbers per node	Drives
Climate	growing season, heat, frost, drought frequency, prevailing winds, storm exposure	crop suitability, harvest reliability, animal survival, sailing seasons
Terrain	slope, elevation, aspect, flood risk, passability	usable farmland, terracing cost, grazing, roads, mines, transport
Living habitat	shares of grassland, woodland (with species mix and age), scrub, wetland, river habitat, coastal nursery grounds	forage, timber, reeds, honey, medicinal plants, fish and shellfish
Geology	ore bodies (grade, size, depth), workable stone, clay beds by use, salt, sand, minerals	mining, building, metalworking, pottery, glass, pigments

Suggestion: bake it from real data, the way HYDE gives population, so the map is history, not invention. Candidates: soils from HWSD/SoilGrids; climate from WorldClim or CHELSA (with CHELSA's palaeoclimate for 300 BC); elevation and slope from the relief data the terrain already uses; rivers from HydroSHEDS; 300 BC forest cover from the KK10 reconstruction (which models ancient deforestation); ores from the USGS mineral database plus the archaeological atlases of ancient mines and Roman quarries. HYDE itself has cropland and pasture grids for 300 BC: a direct check that the farming model puts fields where history had them. Each becomes a `tools/build_*.py` step, like the region mask.

Each crop and herd its own profile

As the designer's additions say: no generic "farmland". Each crop, tree and animal has a suitability profile over the land numbers (e.g. olive: no hard frost, deep well-drained soil, tolerates drought and slope; date: heat plus a reachable water table even under a desert sky; emmer tolerates poorer soil than bread wheat). A node's yield for a crop = best-case yield x suitability x the share of land worked, lowered by nutrient depletion, raised by manure, fallow, irrigation and tools. Herds eat forage, and overgrazing lowers next year's capacity; dung goes to fields *or* to the fire, a real choice.

Change over time: four speeds

The designer's three, plus one:

- **Fixed** on game timescales: bedrock, slope, ore body locations, the shape of a natural harbour.
- **Renewable but vulnerable**: soil nutrients, standing timber, forage, fish stocks, groundwater. Each has a stock and a regrowth rate, and can be run down.
- **Seasonal**: rainfall, river level, soil moisture, grass, navigability. Suggestion: with years (or more) per turn, seasons aren't simulated one by one; each year draws its weather from the node's climate (drought frequency, flood risk), so harvests vary and a run of bad years is possible. Sailing seasons become a cap on how much sea trade a year can carry.
- **Slowly altered by people** (added): deforestation (Lebanon's cedars, the Greek hills), salinisation from irrigation (southern Mesopotamia), harbours silting up (Ephesus, Miletus, Ostia), marshes drained or spreading. These change the "fixed" layer over centuries.

History as the guide, here too

Like population's historical ceiling, bots' land and extraction should follow history: Laurion's silver fading, Spanish mines booming under Rome, Mesopotamia's soils salting, forests shrinking where they did. The player alone can do better (or worse) than history. (DECIDED) Each historical site carries the years it was worked (Laurion to about 100 BC, Las Médulas from about 20 BC), ready for that.

Goods list: additions and grouping

Suggested additions, all historically important on this map in 300 BC: sesame and sesame oil (Mesopotamia's oil, not olive), fodder crops (vetch, lucerne), cotton (a little, Egypt and beyond), natron (Egypt: glass, washing, embalming), bitumen (Dead Sea and Mesopotamia: caulking, mortar), alum (dyeing), cinnabar (red pigment, mercury), silphium (Cyrene's famous and later extinct export: a perfect vulnerable resource), cedar as its own ship and temple timber, garum (fish sauce), leather, war elephants (North African and Syrian herds, captured, not bred), ivory as a raw good, and goods from beyond the map edge (amber, silk, pepper and spices, Indian steel) arriving only by trade.

Suggestion: keep the designer's full list as the *goods*, but show and simulate them through ~12 **families** (the designer's own headings: field crops, orchards, animals, fish and gathering, grain products, oil and drink, fibre and cloth, wood and fuel, stone and earth, metals, metalwork, construction, prestige). The engine tracks every good; the screens lead with families and open to detail. Timber should have a few grades (fuel, building, long straight ship timber), since the designer notes that woodland good for fuel isn't ship timber.

Labour: in antiquity much work was done by enslaved people. Suggestion: model labour as a population input (free, dependent, enslaved), not as a tradeable good. **(decided, with the designer's note: history is king. Labour comes from the population, split as history had it; the slave trade exists as it did, and slavery is abolished as history abolished it.)**

Goods and recipes (built, 25 Sep 2026)

`data/goods.json` holds 148 goods in the designer's 13 families. Amounts are **loads**: what one person makes in a year of full work on ideal land.

- **Raw goods** come from the land layer: each crop and herd from its suitability map, metals, stone and prestige goods from the resource maps, logs from woodland, reeds from wetland. Country people spend a fixed share of their work in each kind of production (fields 42%, herds 16%, orchards 10%, gathering 5%, forests 6%, mines 3%, clay pits 3%), spread over what their place yields, favouring what grows best there.
- **By-products** come with their source: wool and cheese with sheep, hides, horn, tallow and dung with cattle, straw with wheat, beeswax with honey.
- **Made goods** follow recipes, in order (inputs first): grain is threshed, milled and baked; grapes and amphorae make wine; ore and charcoal make bloom iron, then wrought iron, tools and weapons; copper and tin make bronze. Some recipes take any one of their inputs (threshed grain from wheat,

barley, emmer or rye; fuel from wood, brushwood, dung, straw or reeds, so dung burned is dung not spread). How much is made follows what people need and what craftsmen sell, passed back up each chain; people's needs come first, and inputs are shared fairly among the recipes that use them.

- **Needs**: each person uses bread, grain, pulses, vegetables, milk, cheese, fish, salt, fuel, pottery, oil, wine, cloth and tools each year. What a realm can't make shows as a shortage (trade will cover it, section 3).
- **Value and taxes**: every good has a price in drachmae (a made good's is its inputs plus its labour at 200 drachmae a year). The realm's output is the value of all it makes, less what was used up making it, plus the townspeople's trade and services. Taxes and tribute are a share of this output (it replaces the flat 100 drachmae a person).
- **On screen**: the Goods button (or G key) opens the panel: value by family, each opening to its goods (made, used, needed, spare or short).

Harvests, weather and renewable stocks (built, 25 Sep 2026)

- **Weather** (decided: a yearly draw). Each geographic region draws its harvest every year: 1 is an ordinary year. The draw mixes a shared part (a bad year across the whole map) with the region's own, and swings more where rain is unreliable (the land layer's rain variability) and less where rivers and irrigation water the fields. The same year always has the same weather. Below 75% is a famine, above 120% a bumper year; both make the chronicle in the player's lands.
- **Stocks** per region, each 100% as nature left it: soil nutrients, standing forest, pasture forage and fish. They wear down when the region's people press on what its land can feed (above half its carrying capacity) and recover when rested: fish within a few years, pasture in a decade or two, soil in decades, forests in a century. Dung spread on the fields speeds the soil's recovery; dung burned as fuel doesn't (the designer's trade-off).
- **Effects**: field crops yield harvest x (50% + 50% x soil); orchards feel the weather less; herds follow pasture; fishing follows fish; timber follows forest. Carrying capacity follows soil and pasture. The growth drivers' Climate factor takes the harvest and the Food factor the state of the land (bounded, so history stays on course).
- **On screen**: the province panel shows its region's harvest this year and its soil, forests, pasture and fish.

Trade (built, 25 Sep 2026)

- **Who trades**: realms linked by a border or a trade route, and through middlemen (see "Trade routes" below; this replaced the first rule, where every coastal realm traded with every other). Realms at war don't trade.
- **What**: once a year each realm offers what it can spare (after its own people and crafts) and asks for what its people lack. A seller shares its spare goods among its partners in proportion to what they lack.

- **Prices**: one price per good, its usual price times the square root of want over supply, between half and three times.
- **Money**: buyers pay and sellers earn at that price. Merchants keep 10% of what they carry (added to the realm's output), and the state takes 5% in tolls and customs, a new line in the treasury.
- **Needs and unrest**: the share of people's needs met (by value) is shown in the Goods panel. Below 80%, want adds unrest in every province of the realm (up to 40% at nothing).
- **From beyond the map**: amber (by the Amber Road, arriving in Pannonia and Scythia), silk (Hyrcania, Media), pepper and spices (Arabia Felix, Persis, Aethiopia) and Indian steel (Persis, Hyrcania) arrive each year in whoever holds those regions, and travel on only by trade. They are wanted, not needed.
- **Farming richness**: where the fields yield more per hectare than the typical farmer's (the watered Nile valley), each farmer grows more (up to 2.5x), so Egypt sells grain.
- **Slaves**: the slave trade comes with labour (section 4), since people are counted by the population, not as goods.

Labour and people (built, 25 Sep 2026)

Decided: history is king. `data/labour.json` gives, for every geographic region, the shares of its people who were **dependent** (bound tenants, serfs, Egypt's royal farmers, helots, clients) and **enslaved**, at points through time (Italy's enslaved share grows from about 10% in 300 BC to a quarter in the late Republic, then falls as tenancy and serfdom rise), interpolated between them, and the year slavery was abolished in law in each region's lands (from then the enslaved share is 0). The rest are free. The figures are approximate (Scheidel 2008; the Cambridge Economic History of the Greco-Roman World) and meant to be refined.

- **Levies**: only free men serve in full; dependents give half as many; the enslaved none. A realm's manpower is scaled by this.
- **Mines**: the enslaved worked the mines (Laurion, the Spanish silver mines): a region's mine output is multiplied by 1 + 2 x its enslaved share.
- **Unrest**: where more than 15% are enslaved, unrest rises (the risk of servile war).
- **Captives and the slave trade**: a conqueror carries off 5% of a taken province's people as captives (not after abolition there). Captives count among the realm's enslaved; 5% a year die or are freed; beyond 5% of the realm's people, they are sold in the slave markets at 300 drachmae each, and the silver reaches the treasury.
- **On screen**: the Treasury and Army panel shows the realm's free, dependent and enslaved shares and its captives, and the sale of captives in the accounts.

What it feeds

- **Carrying capacity**: the food a region's land can grow: calories from crops, herds and fish at its current tech (built; see Crop yields and carrying capacity).

- **Growth factors**: food security (harvest against need), land and living standards (land per person), disease (marshes, malaria zones).
- **Attraction**: mines, ports, markets and quarries pull people.
- **Economy, military and Might** (later build steps): output, what can be built, which units can be raised.

Suggested build order within step 2

1. The land layer: bake the six parts per node from real data, show each as a map view, and check it against known history (fields where HYDE has cropland, forests where KK10 has them).
2. Raw-resource potentials from the suitability profiles, and carrying capacity from food, replacing the 3x stand-in. Re-run the population balance tests.
3. Renewable stocks (soil nutrients, forests, forage, fish) with depletion and regrowth, and the yearly weather draw.
4. Goods and recipes, with the economy (build step 4), where they're first needed.

Each part gets balance tests like population's: a realm doing nothing tracks history, maxed effort stays within bounds, a depleted stock can recover.

The land layer as built (25 Sep 2026)

83 values for every one of the 284,626 land nodes, in `data/land/` (6.4 MB), baked by `tools/build_land_layer.py` from sources fetched by `tools/fetch_land_sources.py`, plus `tools/land_sites.json` (88 historical sites and the hand fixes). Every source allows selling the game:

Part	What's in it	Source (licence)
Terrain	elevation, steepness, ploughable flat share, ruggedness, which way slopes face, distance to sea, coastal shallows	ETOPO 2022, NOAA (public domain)
Climate	average, summer-high and winter-low temperature, rainfall and its seasonality, growing season, frost days, dryness, wind, storms, plant growth; derived drought risk and year-to-year rain variability	CHELSA V2.1, 1981-2010 (CC0)
Soil	clay, sand, silt, organic matter, nitrogen, pH, nutrient holding, stones; derived depth, drainage, fertility, salinity, erosion, compaction	SoilGrids 2.0, ISRIC (CC BY 4.0)
Water	largest river, distance to a river, lakes; derived floodplain, marsh, groundwater, irrigation water, springs, water quality	Natural Earth (public domain)
Habitat, 300 BC	farmed and grazed, forest (and its conifer share), scrub, grassland, marsh, desert; shares add up to one	KK10, Kaplan et al. (CC BY 3.0), with natural cover derived from climate
Resources	39 goods: metals, salt, sulfur, bitumen, natron, marble and other stone, fine clay, glass sand, cedar, ship timber, papyrus, murex, frankincense, myrrh, balsam, silphium, horses, elephants, ivory…	USGS MRDS (public domain) and the historical sites

Choices made while building it:

- **Modern climate, not ancient.** The ancient-climate version of CHELSA (TraCE21k) is licensed CC BY-SA: "share-alike" would bind the game's own data files to that licence. The CC0 modern averages are used instead; the Roman Warm Period was close to them, and known differences are hand fixes.
- **Hand fixes where modern data is wrong for 300 BC:** KK10 models farming from rainfall, so it put Egypt's Nile valley at ~1% farmed; the fixes set the Nile valley, the delta, the Faiyum and Babylonia as farmland and floodplain. Also the Mesopotamian marshes, the Pontine marshes, Lake Copais, Lake Moeris and the delta lagoons (all drained or shrunk since), and the salting of southern Mesopotamia.
- **Growing season** is CHELSA's rain-fed one, so irrigated Egypt shows a short season: irrigation extends it, which the crop model will use.
- **Deposits** from USGS are modern knowledge, counted at half strength as potential; the historical sites are what antiquity actually worked, each with its years.

Map views show it in the game: the Map view menu (bottom right) lists Political, Regions and 52 land views grouped by part; a legend top-left explains the view, names its source, and shows the value under the mouse. `src/Tests/LandLayerTest.cs` checks known places (the Nile floodplain, Alpine frost, Laurion's silver, Tyre's murex…), that habitat shares add up to one, that farmland follows where HYDE puts people (r = 0.61), and that every source's licence is cleared for a commercial game.

Next: raw-resource potentials from per-crop suitability profiles, and carrying capacity from food, replacing the growth drivers' 3x stand-in (built: see below).

Crop yields and carrying capacity (built, 25 Sep 2026)

`src/World/CropModel.cs` reads 31 profiles from `data/crops.json` - 13 field crops (wheat, emmer, barley, millet, rye, oats, lentils, chickpeas, peas, broad beans, sesame, flax, hemp), 8 orchards and gardens (olives, grapes, figs, dates, pomegranates, almonds, walnuts, vegetables), 9 herds (sheep, goats, cattle, pigs, horses, donkeys and mules, camels, poultry, bees) and fishing - and scores every place 0-1 for each from the land layer. Each profile has its own needs, as the designer asked: rain (or irrigation) in a range, temperature, the winter cold it survives, the summer heat it needs to ripen, pH, salt tolerance, drainage, soil depth, and how much it depends on fertility (legumes make their own nitrogen). Some needs are particular: dates need a water table or irrigation whatever the rain; millet and sesame are summer crops, so north of the Sahara's dry summers they need irrigation; winter-sown grain is judged on the cool season it grows in (Egypt's winter wheat and barley); grapes like south-facing slopes; goats like rugged ground; cattle need water. Yields are ancient ones on good land (wheat 1.1 t/ha, barley 1.1, emmer 0.9, olive oil 0.25, dates 3…). The numbers are data, so they can be adjusted without touching code.

Carrying capacity of a place = the food it could grow at most with ancient methods, in people fed (2,000 kcal a day, less 15% lost):

- **Fields**: the best food crop on the flat land. Rain-fed farming sows at most 40% of the flat land (the rest is woodland for fuel and pasture for the plough oxen) and lies fallow every other year; irrigated land is sown up to 85% and cropped yearly.

- **Orchards and terraces**: the best orchard on 20% of the slopes.
- **Herds**: milk and meat from the rest, by how much it grows and what it is (grass, scrub, forest, fallow, marsh, desert).
- **Fish**: coastal shallows, rivers, lakes and marshes.
- **The ancient plough**: yields on heavy clay are up to 35% lower: the ard scratches light soils, and heavy clay waits for the mouldboard plough, a technology to unlock later (the Po valley stays modest until it's drained and ploughed deep, as happened).

It computes in about a second at load. Against history (HYDE), in people:

Region	Food capacity	300 BC	Peak before 1700
Italia	18.2 M	4.4 M	12.6 M (69%)
Aegyptus	11.7 M	3.2 M	4.9 M (42%)
Syria	6.3 M	2.4 M	5.9 M (94%)
Gallia	29.2 M	2.4 M	14.2 M (48%)
Hellas	7.3 M	1.2 M	1.5 M (21%)
Sarmatia	19.8 M	0.1 M	0.8 M (4%)
Whole map	479 M	39.4 M	

Every region held fewer people in 300 BC than its land could feed; long-settled farming lands came close to their capacity by 1700, while the steppes and frontiers stayed far below it, as history had them.

It replaces the growth drivers' stand-in. A region's carrying capacity is now its food capacity - but never less than 5% above what history actually had there, since history proves that food existed (grown, herded or imported). Positive growth fades to zero as a region nears it. A new balance test checks it binds: a player-held Syria with every growth factor maxed for 400 years reaches 82% of the 6.3 million its land can feed, and never more.

Map views: a "Crops and food" group - food capacity (people per km²) and each crop, tree, herd and fishery's suitability. `src/Tests/CropModelTest.cs` checks crops grow where history grew them (olives at Athens, not in the Alps; dates on the Nile, not in Greece; camels in Arabia; millet in the Sahel) and the capacities against HYDE.

Still to come in this step: yearly harvests from the weather draw (the land's drought risk), and the growth factors' food security read from harvest against need.

Cultures and loyalty (built, 25 Sep 2026)

Every province has a people (culture) and a religion, as in 300 BC (`data/cultures.json`: a default for each geographic region, with provinces that differed, such as Latin Latium, Etruscan Etruria, Jewish Judaea, Punic western Sicily). Each playable realm has its ruling culture (the Ptolemies and Seleucids are Macedonian); kin cultures (Latin and Italic, Greek and Macedonian, Punic and Phoenician, ...) count as close.

- **Integration** (0 to 100%): how fully a province is part of the realm. Provinces held at the start begin at 100% if they share the ruler's culture, 80% otherwise. A conquered province starts at 0% (50% if it is the conqueror's own people) and rises each year: fully in about 10 years among one's own people, 40 among kin, 100 among foreigners; half as fast while the realm is at war or taxing heavily.
- **What it changes:** a province pays tax and gives levies at 50% + 50% x integration; the rest of its people count as unorganized (tribute only).
- **Unrest:** 0.6 x (1 - integration), plus tax (-10% low, +15% heavy, +35% crushing), +10% for a different religion, +30% for each 100% the realm's province count exceeds the court's capacity of 15.
- **Revolt:** only in the player's realm (other realms' revolts follow history, decided). Above 50% unrest, a province has a yearly chance of (unrest - 50%) x 0.3 to rise and break away as unclaimed land.

Score and goals (built, 25 Sep 2026)

Decided: a sandbox with optional goals. `data/goals.json` gives every playable realm history's ambitions for it (Rome: unite Italy, take Sicily, break Carthage in Africa, rule "our sea"; Egypt: hold Coele-Syria, keep Cyrene, rule the Aegean, the riches of the Ptolemies; and so on) plus common goals (double your people, rule 30 provinces, 10,000 talents and no debt, still standing in AD 1). A region goal needs 60% of the region's people in your land. Reaching a goal is checked every year, marked with the year, and makes the chronicle.

Score = people / 100,000 + 1 a province + (treasury - debt) / 1,000 + the points of every goal reached. The Goals button in the top bar shows the score; its panel lists each goal with how near you are.

First-game guide: a "How to play" panel opens the first time the game is played (and from the Goals panel any time).

Balance fixes with it: - Rome's Italian allies paid their own contingents, so Rome pays half its army's upkeep (start_realms.json, upkeep_share 0.5). With it the AI's Rome fights the Pyrrhic War (281 BC), both Punic Wars (264 and 218 BC) and Cisalpine Gaul (225 BC) on history's timetable. - Other realms no longer hoard: with three years' income saved they lower their taxes and spend a fifth of the excess each year on temples, palaces and largesse; at war they spend their war chest over about ten years; in debt they raise taxes. - Random draws (weather, battles, revolts) now come from a hash that is the same on every run, so a saved game and the tests always play out the same way.

Armies and sieges (built, 26 Sep 2026)

Decisions "Playable 9, 10, 12": named armies based in provinces, every culture's own units, sieges over years.

- **Units** (`data/units.json`, 52 kinds): every people's own, in seven roles (heavy and light infantry, archers and slingers, cavalry, horse archers, elephants, warships), each with its Might, men, cost, upkeep, a resource it needs, and a description: hastati and principes, Companion cavalry, the Sacred Band, Numidian horse, scutarii, warbands, falxmen, Scythian horse archers, cataphracts, Kushite bowmen, camel riders… A realm raises the units of its own people and of every people whose province it holds (Carthage, holding Numidians, raises Numidian horse), plus anyone's levies, skirmishers, slingers, light horse, triremes and (with elephant country) elephants.
- **Armies**: each realm has named armies (Rome's are Legio I, II…; the Hellenistic kings' the Royal army; the tribes' warhosts), each standing on a place on the map with its own list of units and its own weariness. The Armies panel raises units into an army, sends units home, moves an army anywhere in your own land (click Move, then the map), founds new armies at the capital, and chooses the army Conquest mode paints for. Armies of yours and of your enemies show on the map.
- **Reach** is now per army: 400 km over land from where it stands in a year; with warships in the army the sea costs a third as much.
- **Sieges**: painting enemy land and ending the turn sends the chosen army to lay siege; it marches to the place. Each year a siege advances by 0.35 x (besiegers / garrison)^0.6 x (realm Might ratio, clamped 0.5-2)^0.3 (between 5% and 100% a year): about three years between equals, one year for an overwhelming army. The garrison is the place's militia, the province's walls (4 Might) and any of the owner's armies standing there. Each year the defender may march a relief army (60% of its armies not besieging, shared among its sieges) against each siege: a battle by the usual odds; if the besiegers lose, the siege is lifted. Besiegers lose 2% a year to disease and desertion and tire. When a siege is complete the place changes hands, captives are taken and the war score moves. An army split between several sieges divides its strength.
- **Other realms** besiege the same way with their main army, a few places at a time.

Pretexts, war exhaustion, peace terms, alliances and vassals (built, 26 Sep 2026)

Decisions "Playable 15, 16, 17, 19".

- **Pretexts** (in the spirit of Stellaris' casus belli, not a copy): historical claim (history's own war for your realm in its years), reconquest (land you held within 50 years), free our people (they rule a province of your culture), border dispute (neighbours), subjugation (a neighbour with a third of your Might or less: the prize may be their submission), war of faith (neighbours with other gods), or none at all. Each costs aggression on declaring (0 to 25) and for each province taken (1 to 8).
- **Aggression** (0-100) fades by 2 a year. It lowers every realm's opinion of you (0.8 a point). At 50 or more, neighbours who think ill of you (-20 or worse) form a coalition: they defend each other against you, and a coalition half again stronger than you may strike first.
- **Opinion** of another realm, with its reasons shown: kindred people (+10/+20), the same gods (+10) or others (-5), allies (+40), overlord and vassal (+20), at war (-60) or a recent war (-20), old rivals (-30: Rome and Carthage, the Ptolemies and Seleucids, the Antigonids and the other Successors, Carthage and the Sicilian Greeks, Rome and the Gauls), a marriage between their ruling houses (+15), and fear of your conquests.
- **Alliances**: each defends the other. When a realm is attacked, its allies, coalition partners, vassals and overlord join (a far-off ally of another realm stays out, as history would; the player's allies and the allies of a realm the player attacks always come). In force in 300 BC: Seleucus with Lysimachus, Ptolemy with Lysimachus. A realm accepts your alliance at an opinion of +25; friends facing your enemies offer theirs. Breaking one costs 5 aggression.
- **Vassals** pay their overlord a tenth of their income a year, fight in its wars and make none of their own. A far weaker realm (a third of your Might) that thinks well of you may submit without a war; or vassalage is a peace term.
- **War exhaustion** (0-100 each side): +3 a year, +30 for losing a realm's sustainable manpower in men, +8 for each province lost, +2 for each of its places under siege. At 100 a side must make peace: the winner takes the places it has half besieged, and tribute if it leads by 40.
- **Peace terms by war score**: white peace; each province (8-40 by its share of the loser's people; half if already half besieged, half again if it was once yours); tribute (20); vassalage (60, on a subjugation pretext or with 60 war score). The loser pays up to its losses plus half its exhaustion. The Diplomacy panel shows each term's cost and whether they would accept.
- **Appeasement** (only toward the player, or as history allows): a beaten or exhausted enemy sues for peace offering silver and the places already falling; a city under siege may offer a ransom (about 20 drachmae a head) to have the siege lifted. Offers wait in the Diplomacy panel for two years.
- **Other realms** declare history's wars only with half the defender's strength (its allies counted), concentrate their army on one new siege a year, and press where they can reach when history's regions are out of reach.

Buildings, province tabs, province taxes and remedies (built, 26 Sep 2026)

Decisions "Playable 5, 6, 31, 32".

- **Buildings** (`data/buildings.json`, the core set): irrigation works (+25% field crops; needs a river or floodplain), granary (a bad harvest hurts half as much), terraces (+30% orchards; needs hills), mines (+50% ore and stone; needs a deposit), workshops (+15% made goods, weighted by the province's share of the realm's people), market and fora (+10% trade profits and customs, likewise), harbour (+30% fishing, +10% trade, warships a quarter cheaper for the realm; needs a coast), roads (+25% integration speed, +5% trade), city walls (+4 garrison Might, can be built twice), barracks (+20% levies from the province), great temple (-10% unrest, +20% integration speed), aqueduct and baths (-5% unrest, better health for the region's growth; needs a town). Each costs silver, takes years (halted while besieged) and has upkeep (added to administration). One building at a time per province. Other realms with silver to spare and at peace build too.
- **Province panel** (essentials plus detail tabs): name, realm, area, people and region at the top; tabs for People (culture, worship, who works, integration, unrest, the province's own tax rate), Land (harvest, soil, forests, pasture, fish, resources), Buildings (built, under way, what can be built with costs and reasons) and Military (sieges, armies there, the garrison).
- **Province taxes**: any of your provinces can have its own tax rate instead of the realm's; its unrest follows its own rate.
- **Remedies for an empty treasury**, offered only when it is in trouble (in debt, or short of a year's army and administration): debase the coin (a year's income now; customs -20% and +5% unrest for ten years), borrow the temple treasures (half a year's income; +15% unrest for five years), sell the tax farms (40% of a year's income; taxes -10% for five years; needs three provinces), a levy on the rich (30%; +10% unrest for a year), or ask a friend (an ally or overlord at +30 opinion may send silver). The silver pays off debt first.

Technology, administrative reach, corruption, rivals and score categories (built, 26 Sep 2026)

Decisions "Playable 21-26".

- **Technology web** (`data/techs.json`): 732 technologies in 15 branches, each running from 300 BC to today: farming, industry, metals and chemistry, energy, building and cities, transport, trade and finance, writing and communication, land and air warfare, seafaring and navies, government and law, society and ideas, science, medicine, and religion and the arts. Nothing invented before 300 BC is a technology: it is already part of the world at the start. Each has a year it becomes known to the world, prerequisites, a cost that grows with its year, and effects (crop yields, crafts, trade, tax, corruption, interest, manpower, garrisons, sieges, reach, sea travel, health, integration, unrest, admin capacity). Units and buildings can require a tech.
- **Research**: research points a year = (6 + town people/15,000 + organized people/300,000) x (1 + research bonuses). The player picks a tech in the Research panel (T key); bots choose their own.
- **Administrative reach**: provinces more than 700 km from the capital pay less tax and are less loyal. Admin capacity (from techs) sets how many provinces a realm runs well.
- **Corruption**: 5% + 25% x overreach (provinces beyond capacity) minus tech; it eats that share of tax income.
- **Rivals**: a powerful faction grows with corruption and overreach; the player can win them over with silver ("Win them over" in Treasury).
- **Score by category** (like Stellaris): People, Land, Wealth, Culture, Dynasty and Goals, shown in the Goals panel with a ranking of realms.

Plagues, disasters and each realm's coin (built, 26 Sep 2026)

Decisions "Playable 4" and "28".

- **History's disasters** (`data/disasters.json`): 53 plagues, earthquakes, eruptions and famines strike at their real dates and places: the Rhodes earthquake (226 BC), Vesuvius (AD 79), the Antonine Plague (165), the Plague of Justinian (541), the Black Death (1347), Lisbon (1755), the Spanish flu (1918) and more. Each has a centre, a reach in km and the share it kills at the centre, fading toward the edge.
- **Chance**: every region may suffer an earthquake each year if it lies on a quake belt (the Aegean, Anatolia, the Levant, Italy, Iran…), and anywhere may see an epidemic, more likely where many people live.
- **Medicine** cuts plague deaths (up to 90%), from the owner's health technologies.
- The dead are taken from the map's people; the land fills again over the following decades. A disaster in your lands stops a long turn.
- **Coins** (`data/coins.json`): money is silver by weight, and no talents appear anywhere in the game. Every sum shows in your realm's own coin: Roman didrachms, then denarii from 211 BC (lighter over time), antoniniani, gold solidi; Punic shekels; Ptolemaic (14.2 g) and Attic-weight (17.2 g) tetradrachms; Nabataean drachms; Gallic gold staters; Kushite gold by weight. The Treasury panel shows the silver in kg, what one of your coins holds in grams, and what it is worth in your trading partners' coins by the silver in each: if a didrachm holds 7.3 g and a tetradrachm 17.2 g, 1 didrachm = 0.42 tetradrachms. Gold coins count at 12 times their weight in silver.

Trade routes (built, 26 Sep 2026)

Decision "Playable 8".

- **Routes** (`data/trade_routes.json`): 35 historical routes, each a chain of real ports and towns: sea lanes (the western lane, the Tyrrhenian lane, the Sicilian channel, the Aegean, the Levant, the Straits and the Black Sea, the Adriatic, the Red Sea, the Gulf, the Atlantic coast), roads (the Incense Road, the Royal Road, the Great Road to the east, the Amber Road, the Rhone tin road, the Via Appia), and rivers (the Nile, the Tigris and Euphrates, the Danube). Later routes open in their year: the Via Egnatia (146 BC), the Venetian galleys (1000), the Genoese Black Sea route (1261), the Suez Canal (1869).
- **Who trades with whom**: a realm holds a place on a route if its land lies within 45 km of it. Realms linked by a shared border or a shared route trade directly; goods also pass along chains of up to three links through middlemen. Realms at war don't trade.
- **Tolls**: each realm that goods pass through (a middleman, or the holder of the places between buyer and seller on a route) takes 2% of their value. Holding a busy crossroads pays.
- **On the map**: the "Trade routes" map view draws them: sea lanes pale blue, roads gold, rivers blue-green. The Goods panel lists your routes and your tolls.

Town names from Pleiades (built, 26 Sep 2026)

Decision "Playable 23".

- `data/places.json`: 6,203 ancient settlements from the Pleiades gazetteer (CC BY 3.0, credited on the main menu), each with its names over time. In any year a town shows the name used then: Poseidonia in 300 BC, Paestum under Rome; Maleventum before it became Beneventum. About 3,600 stand in 300 BC.
- **On the map**: zoom in past the province names and the towns appear, the most important first (cities, places linked to many others, and places where many people live), never overlapping.
- The province panel lists a province's chief towns, and chance disasters are named after the nearest town.

Our own 300 BC borders, 56 realms, any realm playable (built, 26 Sep 2026)

Decisions "Playable 1", "20" and "30".

- **Borders**: `data/realms_bc300.json` lists 56 realms and the 613 historical districts they held in 300 BC. `tools/build_realm_mask.py` grows every district over the land at once, slowed by mountains, marsh and desert and barely crossing narrow straits, until it meets a neighbour or runs out of reach. Land no one reaches (the Sahara, inner Arabia, the high Alps) stays unclaimed. The old third-party (GPL) border data is gone. The race runs on a coarse grid, then each realm's share is blurred slightly and scaled up smoothly, so borders are curves, not stairs.
- **Capitals**: every realm's seat has a gold star on the map, and its name ("★ Roma", "★ Pella", "★ Meroe") appears as soon as you zoom in a little, before other towns, beside the star wherever there is room. A realm that loses its historical capital moves its seat to its most populous place. The province panel lists the capital first among its towns.
- **Floating panels**: every panel (the chronicle, the province panel, the treasury, goods, diplomacy, research, armies, goals…) can be dragged by any empty spot to anywhere on the screen, comes to the front when clicked, and keeps its place between games.
- **The world after Ipsus (301 BC)**: Antigonos is dead; his son Demetrios keeps a sea kingdom (Cyprus, Tyre, Sidon, Corinth, the Peloponnese garrisons, the islands). Lysimachos holds Thrace and western Asia Minor; Seleukos Syria, Mesopotamia and Iran; Ptolemy Egypt, Cyrenaica and Coele-Syria; Kassandros Macedon, Thessaly and central Greece (with Cilicia under his brother).
- **The new realms**: in Italy the Samnites, the Etruscan League, the Cisalpine Gauls, the Veneti, the Ligurians, the Lucanians and Bruttians, the Messapians, Tarentum and Syracuse under Agathokles; in the west Massalia, the Celts of the Danube, and the Iberian, Celtiberian and Lusitanian peoples; in Africa the Massylian and Masaesylian Numidians, the Mauri and the Garamantes; in Greece and the Balkans the Aetolian League, Sparta, Epirus, Rhodes, the Cretan cities, the Illyrian kingdom, the Dardanians, Paeonia, the Odrysians, the Getae and Byzantium; in Asia Minor Bithynia, Heraclea Pontica, Pontus, Cappadocia and Armenia; Atropatene; Kartli, Colchis and Caucasian Albania; the Bosporan kingdom and the Sarmatians; in Arabia Lihyan, Saba, Ma'in, Qataban and Hadramawt.
- **Rulers**: real where the sources name them (Agathokles and Theoxene, Seuthes III and Berenike with their four sons, Zipoites, Ariarathes II, Parnavaz, Spartokos III, Dromichaites, Glaukias, Audoleon…). Where no one is named (most tribes and republics) the ruler stands for the leading family with a name of the culture.
- **Cultures**: each realm has its own people from `data/cultures.json` (Italic, Etruscan, Thracian, Illyrian, Berber, Cappadocian, Armenian, Median, Colchian, Sabaean and more), and 16 naming traditions give children and new houses fitting names.
- **Any realm playable**: the start screen lists all 56, grouped by region, scrolling. The 19 tribal peoples start without provinces.

- **Armies, treasuries, treaties** for the new realms are in `data/start_realms.json`; new history goals include the Third Samnite War, Pyrrhus in Italy, Lysimachos against the Getae, the Illyrian, Jugurthine and Mithridatic wars.
- A people with no unit of its own for a role hires one from a people who fight that way.

Playability, part 1 (built, 28 Sep 2026)

Section 15, decisions "Next 41-46".

- **Outliner** ("Needs you", right side, floating and collapsible with its ▾ button): offers waiting, wars and their score, sieges and their progress, armies, provinces near revolt, research left idle, debt. Click a line to go there.
- **Hover cards**: rest the mouse on a province for a moment to see its owner, people, culture and faith, loyalty, unrest, garrison and chief towns.
- **Six more map views** (the menu at the bottom right): Culture, Religion, Loyalty, Wealth (what a person makes in a year under their ruler), People (people per km²) and Diplomacy (you, allies, vassals, enemies, truces, rivals, others). Tribal lands show their region's culture and religion. Each view has a key at the top left.
- **Realms table** (L, or "Compare realms" in Goals): every realm's people, land, silver (in your coin), income, soldiers, ships, techs and score, sortable by any column, with a graph of you and the five leaders over the years (people, silver, soldiers or score, recorded every 5 years and kept in saves).
- **Learning to play**: the first time each panel opens, a short tip explains it (once). "Guided first game" in How to play opens ten steps (taxes, research, a building, recruiting, a map view, a year, pretexts, a war, a conquest plan, a province won or peace), each ticked off as you do it.
- **The history of your realm** (decision "Next 47"): when AD 2000 arrives or your realm falls, a closing screen shows your score by category, your rulers in turn, your height, and your people and score over the centuries (also any time from Goals: "Your history so far"). **Closeness to history** (the designer's note): whenever one of history's campaigns (`history_goals.json`) reaches its end date, the game checks whether it turned out as it did (the attacker holds most of the regions' people; for campaigns that failed in history, like Pyrrhus in Italy, that it doesn't); the score is the share that did.
- **Data docs** (decision "Next 51"): DATA.md explains every data file in plain words, and the Data test checks that they agree with each other.
- **Time passing** (decision "Next 43"): beside Advance Year, a play button (or Space) lets the months run (1, 2, 4 or 8 a second); the date shows the month; each January the year is played; time pauses by itself when something needs you (a war, a succession, a revolt, a disaster, the end). Advance Year still plays whole turns. Armies will march month by month with section 11.
- **The look changes with the ages** (decision "Next 49"): Antiquity (Cinzel, bronze and gold), Late Antiquity from AD 250 (Cinzel Decorative, imperial purple), the Middle Ages from 600 (blackletter headings, EB Garamond, red and gold), the Early Modern Age from 1450 (IM Fell English, ink blue and brass) and the Modern Age from 1800 (Josefin Sans and Source Serif, steel). All fonts are SIL Open Font License (licences in assets/fonts). The chronicle marks each new age.
- **Music**: the Score Book (https://claude.ai/artifact/2bQczf4k9RVw2oiv59RfS2) lists the 49 tracks the game needs, for the designer to compose.

The economy rebalanced (built, 28 Sep 2026)

A test game showed Rome clearing some 5 million didrachms a year and piling up over 100 million by 280 BC. Three things were wrong, and are fixed:

- **Soldiers cost what they really cost.** Unit upkeep now covers pay and rations together (about 1.6 times the old figures): a Roman legionary drew 2 obols a day, 120 denarii a year, with his grain on top (Polybius 6.39); a Hellenistic mercenary about a drachma a day. Warships keep their lower upkeep, as fleets lay in their ship-sheds in peace.
- **The court, the gods and the city.** A new yearly expense, "Court, temples and public works": a fifth of the tax taken (palace, festivals, envoys and gifts) plus 0.1 talent per 1,000 people (roads, walls, granaries, magistrates). Ancient states spent nearly everything they took.
- **Not every state could tax alike** ("tax reach" in start_realms.json). The Ptolemies' royal monopolies and land tax (x1.8; Egypt now takes in about 6,300 talents a year; since 15 Oct 2026 x1.35, with the monopolies counted on their own), the Seleucids and Carthage (x1.5) took heavily. Republican Rome's citizens paid only the tributum, a war levy, so Rome takes 0.4 of the usual tax and lived, as it did, on booty, public land and its allies' soldiers.

At the start Rome now clears about 145 talents a year (roughly a fifth of its income), Egypt about 1,300, and most realms run close to even at peace strength. The accounts panel shows the same figures the game uses, techs and corruption included.

Battles and generals, part 1 (built, 28 Sep 2026)

The first part of section 11 (decisions "Next 1-10"): generals, battles that weigh the ground and the arms, battle reports and veterans. Marching by months, supply, fog of war, the tactical battle map, blockades, mercenary companies and reforms follow.

- **Generals** (data/generals.json). Every army has one. Five skills, 1-10: tactics (each point above the enemy's general is worth about 7% on the day), leadership (fewer losses), siegecraft (6% faster sieges a point), logistics (less weariness and siege sickness) and seamanship. Perks add to them or to an arm or a ground: Master of horse, Hill fighter, Master of elephants, Cautious, Reckless, Engineer, and more; four are for great captains only (Genius of war, Father of his soldiers, Stormer of cities, Lord of the sea).
- **Who leads.** The men of the ruling family (18-65) first. When the family runs short the realm appoints commanders, and each year it may meet "a man of great prowess" and raise him (3%, doubled at war); about one in eight is one of the great captains of the age. The great commanders of 300 BC lead from the start: Pyrrhos, Demetrios the Besieger, Seleukos with his elephants, Lysimachos, Ptolemaios and Agathokles. Generals age, retire at 70, and may fall when beaten (8%). In the Armies panel, "Change general" picks another general, a family member, or appoints a new man (20 talents).
- **Battles.** Each arm's strength is changed by the ground where the armies meet (from the land layer: hills, woods, marsh, desert, rivers; cavalry and elephants suffer in the mountains, light troops thrive), by what the enemy brings (horses will not face elephants, as at Ipsus; javelins turn elephants, as at Zama), by the general, by weariness and by veterans. The attacker must cross any river. The beaten side loses about 15% (more to a strong cavalry pursuit), the winner about 5%.
- **Battle reports.** Every battle is kept (the last 300, saved): place, ground, generals, men and losses, the odds and the day in phases. The panel opens by itself after a battle of yours; "Battle reports" in the Armies panel opens it any time.
- **Veterans.** Winning a battle hardens an army (+15% experience, more with some generals); a fully veteran army fights 30% better. Raw recruits dilute it.

Battles and generals, part 2: marching, supply and fog (built, 28 Sep 2026)

- **Marching by months** (decision "Next 3"). Armies no longer jump: each has a route and moves along it every month, about 90 km a month on open ground in summer (20 km a day on the marching days, with halts to forage), half that in winter (November to February). Mountains, marsh, forest, desert and river crossings cost more; weariness slows, a good quartermaster (logistics) speeds. Routes go through your land, your allies' and vassals', your enemies' at war, and land no realm holds; the land of other realms is closed. An army with warships crosses the sea.
- **Plotting a route.** In the Armies panel press Move, then click where the army should go; hold Shift to add stops on the way. The route is drawn on the map; the panel shows where it is going and about how many months it will take; Halt stops it. Painting a conquest sends the army marching to the place, and a siege only advances in the months the army stands before it.
- **Time runs month by month.** With the clock playing (Space), armies move each month; the turn button marches the rest of the year at once.
- **Supply and baggage** (decision "Next 4"). In your own or friendly land an army is fed and its baggage fills (up to 4 months of food). Within about 120 km of your borders supply lines feed it (further with a good quartermaster). Beyond, it forages from the people around it (little in empty land, less in winter) and eats its baggage; when the baggage is gone it starves, losing 4% a month and growing weary.
- **Armies meet.** Armies of realms at war within about 25 km of each other fight a battle (the one on the move attacks). The beaten army gives up its sieges and falls back toward its capital.
- **What your realm knows** (decision "Next 7", partial fog). Your realm sees its own, its allies' and vassals' land, 150 km beyond their borders, and 120 km around its armies. The rest of the land is dimmed, and enemy armies there are not shown.
- **Terra incognita and the fog levels (built, 17 Oct 2026).** Before the game starts you choose two fogs on the realm screen, each Off, Light or Full (your answer "Fog setting choices": separate for map and diplomacy).
- *Map fog*. Off: the whole world is seen. Light: the land is all drawn, but armies beyond your realm's sight are hidden (as above). Full (the default): land and sea your people never knew are blank parchment, as old maps left them, and their realm, province and town names are not written. At the start your realm knows everything within 1,100 km of its capital as the crow flies (for Rome: Italy, Sicily, Greece, Carthage and southern Gaul), the lands of every realm it borders or trades with, and the waters off those coasts. Whatever your realm sees from then on it keeps on the map; when it leaves your sight it is dimmed, as last seen.
- *Diplomacy fog*. What the realms table tells you of other realms' people, land, silver, income, soldiers, ships, learning and score. Off: every realm exactly. Light: the realms you border or trade with exactly, the rest roughly (two figures, marked "~", as travellers' reports). Full (the default): those you border or trade with roughly, the rest not at all ("?"), and they are left out of the graph.

- Both are kept in the save.
- **News that travels and fog in the chronicle (built, 17 Oct 2026).** News of another realm sets out from its capital and travels about 900 km a month (some 30 km a day, with merchants, ships and travellers, along ways a third longer than the straight line): news from Alexandria reaches Rome in about three months. It comes into the chronicle when it arrives, marked "word took 3 months to reach us". Declarations of war and peace come at once, brought by heralds and envoys. With full diplomacy fog, news of a realm you have no dealings with, whose capital you have never seen and which lies more than 2,500 km away never reaches you at all; with light fog everything arrives, late; with the fog off everything is known at once. News still on the road is kept in the save.
- **News speed (built, 17 Oct 2026; your answer "How fast news travels": roads and posts).** Along a finished road (anyone's) news goes as much faster as an army marches there; posts and couriers speed all of it: pigeon post ×1.2, post stations and a postal service ×1.3, courier relays and the Roman cursus publicus ×1.6, the optical telegraph ×3, the telephone ×11, the telegraph and undersea cables ×31 (news in days), radio ×51 and the internet ×101. In the realms table, hovering over a realm's name tells how long its news takes, or that none reaches you.
- **Last-seen armies (built, 17 Oct 2026; your answer "Last-seen news": shown as last seen, with how old the news is).** An enemy army that goes out of your sight stays on the map, faded, where you last saw it, marked "last seen 4 mo ago". The sighting is forgotten when you see that spot standing empty, when the war ends, or after a year. Sightings are kept in the save.
- **Other realms under fog (built, 17 Oct 2026; your answer: they see only what they know, as you do).** Every realm judges the others through the same diplomacy fog you play with: exactly, roughly (off by up to a quarter either way, the same error all year), or not at all. A realm weighing a war of history's against a realm it knows only roughly may misjudge it; a strong realm can fall on a weak player only if it knows of the player. (What other realms' armies can see on the map comes with "Scouts".)
- **Who you can deal with (built, 17 Oct 2026; your answer: only realms you know, widening with contacts and trade).** The diplomacy panel lists, and you can propose treaties to or declare war on, only the realms you border or trade with, are at war or in a treaty with, or whose capital your realm has seen (with full map fog). With light diplomacy fog, any realm whose capital lies within 2,500 km is known as well; with the fog off, every realm. The panel says how many realms lie beyond your knowledge. Rome in 300 BC, for instance, cannot yet treat with Ptolemaic Egypt; the two first exchanged envoys in 273 BC.
- **Trust and fear (built, 17 Oct 2026; your answer: separate trust, do you keep your word, and fear, your might and aggression).** Every realm has a trust from 0 to 100, starting at 50. Breaking an alliance costs 20 (it no longer adds aggression), stopping an indemnity you owe 15, a war with no pretext 10; honouring an alliance call earns 3; trust drifts back toward 50 by 1 a year. Others' opinion moves by 0.4 for each point of trust above or below 50 ("they keep their word" / "they break their word"). Fear is what a realm feels for another's conquests (0.8 for each point of aggression) and, for neighbours and partners, for its might when it is over twice as strong (up to 30 more). Fear lowers opinion, but a feared realm bows more readily: a demand of submission needs their opinion plus one and a half

times their fear to be at least 0 (and three times their might, as before). The diplomacy panel shows each realm's trust in you and fear of you, and their army only as well as you know them.

- **Paying off invaders (built, 17 Oct 2026; your answer: pay tribute to buy peace from raiders).** At war, the diplomacy panel offers "Buy peace": you pay the enemy a year of its income, more the better the war is going for it (one and a half years at a war score of 12 in its favour, two at 25), and peace follows with each keeping what it holds. Raiding peoples (the many-tribed peoples, who came for plunder) take half. In 390 BC Rome paid the Gauls a thousand pounds of gold to leave the city.
- **Demands and insults (built, 17 Oct 2026; your answer: send demands and insults).** At peace, each realm's row offers:
- *Demand tribute*: they pay a tenth of their income a year for ten years if you have twice their might and their opinion of you plus one and a half times their fear is at least 10. If they refuse, they think a little worse of you, and the refusal is an affront: for five years you have a new pretext for war, "An affront to avenge" (as Rome's fetial priests demanded redress before declaring a war).
- *Insult*: they remember it (an old wrong of 15) and gain that pretext against you for five years. If they are strong enough (and their ruler hot-tempered) they may declare war on you at once: a way to be attacked rather than to attack, so that your allies are called in and the world sees you as the wronged side. The buttons now wrap onto a second line in a wider panel.
- **Captains who rise (built, 18 Oct 2026; your answers: by deeds and by chance, to a lordship or a throne if they hold land and their men are loyal).** When an unpaid or slighted captain turns on you while standing in your land (not your capital's province), he no longer just takes the province for no one: he makes it a lordship of his own, a new realm ("the Lordship of Campania") ruled by him and his house, with his company as its army, as the Campanian mercenaries took Messana in 288 BC and ruled it as the Mamertines. His former employer bears it a grudge. Each victory he has won makes such a bid a tenth likelier (up to three times). New realms are kept in the save like the realms of 300 BC, and the same way of founding a realm mid-game will serve history's new realms, pretenders and civil wars.
- **Companies sized to history (built, 18 Oct 2026; your answers: to history's numbers, 500 to 5,000 men; armies hold an even number of units).** Each historical company now has its men from the sources (data/mercenaries.json, "men"): the hoplites of Taenarum 2,000, the Cretan archers of Knossos 1,000, the Rhodian slingers 500, Leonnorios' Galatians 5,000, the Gaesatae 5,000, the Mamertines 4,000, the Aetolians 5,000, and so on. Each kind of troop is split into units of about its usual size, and if that makes an odd number of units, the largest kind is split once more. Companies raised by chance at a hiring ground have 500 to 5,000 men of one or two kinds, also in an even number of units.
- **Score parts (built, 18 Oct 2026; your answers "Score parts": eight parts, closeness to history switchable; "Score weights": fixed weights shown).** The score is now People, Land, Wealth, Culture (buildings and integration), Dynasty, Knowledge (half a point per technology), Wonders (each as great as it was), History (2 points for each of history's campaigns that turned out as it did; your realm only, since the others are history's own) and Goals. Each part shows its weight beside it. Settings, "Score closeness to history", leaves the History part out. Of "How close to history" (borders, events

and people), the events are counted now; borders come with "Later borders" and people with "Great people".

- **A searchable chronicle (built, 18 Oct 2026; your answer: filter by kind, realm and place, search, and read the whole game's history).** The Chronicle box has a "Read it all" button. It opens the whole game's chronicle, newest first and grouped by year, with a search box and three filters: the kind of news (wars, peace, conquests, revolts, disasters, rulers and houses, families, the treasury and works), the realm (yours first, then every realm the chronicle has named) and the place (every province the chronicle has named). The newest 3,000 lines are shown; a search finds older ones.
- **Changeable keys and map view keys (built, 18 Oct 2026; your answers: keys for everything, changeable in Settings; a key for each view and a favourites bar).** Settings has a Keys tab: every action with its key; click one and press the new key (a key taken from another action leaves that one without, so no key does two things), and a button puts them all back. The defaults: Enter plays the year, Space runs or pauses the months, 1-3 the map modes, W A S D move the map (the arrows always do too), F1 political, F2 trade routes, F3 culture, F4 religion, F5 loyalty, F6 wealth, F7 people, F8 diplomacy, F9 regions, R roads, H the going, U supply, O trade goods, G goods, T research, L the realms table, C the whole chronicle, F11 fullscreen. Esc always opens the menu. Beside the map view menu a ☆ adds the view shown to your favourites bar, a row of one-click view buttons kept between games.
- **Comparing two realms (built, 18 Oct 2026; your answer: side by side, with graphs).** Below the realms table, "Side by side" picks any two realms (yours and the highest-scoring other at first): their people, land, silver, income, soldiers, ships, techs and score in two rows, as well as the diplomacy fog lets you know them, and a graph of both over the years for the measure chosen above it.
- **What pops up (built, 18 Oct 2026; your answer: a window only for major events and choices; the rest in the chronicle and outliner).** Windows open by themselves only for choices (offers, battles you fight on the battle map), the end of the game, and great battles: a battle of yours with 20,000 men or more in all, or 5,000 or more dead, opens its report; smaller fights are told in the chronicle and kept in Battle reports.
- **Nested hover cards (built, 18 Oct 2026; your answer: hover a word in a card for its own card, as in Crusader Kings 3).** In a province's hover card the realm, the people and the faith are underlined; resting the mouse on one opens its own card beside it: a realm's ruler and age, its people (as well as the fog lets you know), its people and gods, and how it stands with you; a people's provinces (how many yours) and the realms they live under; a faith's provinces. Those cards have underlined words too, so you can follow on as far as you like. A card stays open while the mouse is on it, and the chain closes when the mouse leaves. Card titles are in gold rather than bold.
- **Pinning (built, 18 Oct 2026; your answer: pin any province, character or realm to the outliner).** A pin button on the province panel, on a person's panel and on each realm's row in Diplomacy puts it in a "Pinned" group at the top of the outliner, with a live line (a province's owner and unrest, a realm's opinion of you or its war with you, a person's age). Clicking the line takes you there; right-clicking it unpins it. Pins are kept in the save.

- **Your notes (built, 18 Oct 2026; your answer: pin notes on the map and in the chronicle).** A province's History tab has a box to write a note on it; its notes are listed there (each can be struck out) and shown on the map as a small scroll with the note's first words. The whole chronicle has a box to write a note in the chronicle under this year, and a "Your notes" filter; notes are never thinned out of old years. Notes are kept in the save. (Whether they go into the history book waits on the question "Notes".)
- **Outliner contents (built, 18 Oct 2026; your answer: armies, fleets, sieges, research, building, envoys, plots, family, each group collapsible).** The outliner now has: Pinned, offers waiting, Wars, Sieges, Armies (resting or marching), Fleets (warships, sailing), Unrest, Research (what each branch is studying), Building (each province's work and how many more are queued), Family (your ruler and heir, or a warning that there is none) and Treasury. Click a group's heading to fold or unfold it. Envoys and plots join it when they are built. It never runs under the province panel: it shows what fits and "…and N more".
- **More map views (built, 18 Oct 2026; your answer: also trade goods, supply, literacy, roads, terrain passability, religion spread and history's borders).** Four new views, each with its key: Roads (R; each province by its best finished road), Terrain: going (H; how hard its ground is to march over: mountains, marsh, forest), Supply (U; how great an army its people can feed by foraging) and Trade goods (O; the good its land yields most). Religion spread is the Religion view (F4). Literacy and history's borders come with their systems.
- **Search (built, 18 Oct 2026; your answer: a search box for places, characters and realms).** F opens Find: type two letters or more and it lists the provinces, towns, people and realms of that name your realm knows of (the fog applies: no far realms you know nothing of, no people of houses you have never dealt with, no land never seen), names that begin with your letters first. Clicking one goes there: a province or town centres the map, a person opens their panel, a realm opens Diplomacy (or your own realm's panel). Whether it also searches the Codex and the chronicle waits on "Search scope".

Battles and generals, part 3: the battle map, sea battles, blockades (built, 28 Sep 2026)

- **The battle map** (decision "Next 1"). When your army meets an enemy, time stops and the battle map opens: a 20 by 12 grid whose hills, woods, marsh and river come from the ground where the armies met. Each side's troops stand in blocks (heavy foot in the centre, light troops and archers before it, horse and elephants on the wings), with a strength bar (gold) and a morale bar (blue).
- **Playing it.** Click one of your blocks, then a lit square to move it, or an enemy ringed in red to strike. Each block may move, then strike, once a turn: foot 2 squares, light troops 3, horse 4; archers and slingers shoot 3 squares, horse archers 2. Blocks can't slip past an enemy beside them. End turn lets the enemy move. "Let the general decide" plays the rest for you.
- **What decides it.** The old matchups (horse rides down skirmishers and struggles against formed foot, elephants scatter horse, javelins turn elephants), the ground (hills shield those on them, forest hides light troops and hampers horse, marsh and rivers weaken), flanks (each other block already on the target adds 30%, horse into a flank 50% more), the generals' tactics, veterans and weariness. Losses shake morale; a block with little morale or strength left flees, shaking those beside it. A side breaks when less than 30% of it still stands; after 15 rounds the stronger side keeps the field, and a drawn day is the defender's.
- **After the battle** the losses on the map become the armies' losses (fewer under a good leader, more for the routed), and the day goes into the battle reports.
- **Sea battles** (decision "Next 5"). Fleets that meet fight at sea: an all-water battle map for yours, the admirals' seamanship for the rest. Fleets can be sent out to sea like armies.
- **Blockades.** Enemy warships at least half as strong as a realm's own fleet, standing off its coast, cut a quarter of its sea trade each (at most 80%); the year's customs fall by the average. A besieging army with ships takes a coastal town half again as fast.
- **Setting.** Settings > Gameplay > "Fight battles yourself" (on). Off, your generals fight every battle.

Trade: your follow-up answers (built, 2 Oct 2026)

- **Markets** ("A market in each great city"): 20 of history's great markets (data/markets.json) open in their years: Rome, Alexandria, Carthage (until 146 BC, again from 29 BC), Syracuse, Rhodes, Delos (the free port, 166-88 BC), Antioch, Seleucia on the Tigris, Corinth (until 146 BC, again from 44 BC), Athens and the Piraeus, Ephesus, Byzantion, Tyre, Massalia, Gades, Puteoli (from 194 BC), Aquileia (from 181 BC), Petra. Each place belongs to the nearest open market; each realm's people are shared among its markets. Each market sets its own price for each good from what the realms it serves spare and lack; a realm buys and sells at its markets' prices (a trade between two realms at the average of both). In 300 BC 17 goods are priced differently by market (lentils from 0.5 to 3 times their usual price).
- **Merchants** ("You send merchants to markets to steer trade to you"): one merchant, plus one for each open great market in your land (at most five). Each takes 2% of its market's trade as customs, shared with the other realms' merchants there. Other realms send theirs to the busiest markets where their people trade. (Goods panel > Markets.)
- **Price shocks** ("shown in the chronicle"): grain prices at a market of yours rising to 1.4 times last year's are told, with the likely cause (enemy fleets, war, or poor harvests).
- **Price limits** ("Price limits by law, with shortages and black markets"): until laws exist, an edict in the Goods panel. Grain is bought at no more than its usual price; sellers sell less (the realm goes short by the price's excess) and the shortage adds 5% unrest.
- **Embargoes and trade treaties** ("as diplomatic actions"; Diplomacy panel): an embargo stops all trade between the two realms, even through middlemen; a treaty lets two realms trade directly with no border or route. They accept a treaty unless their opinion of you is below -20.
- **Pirates** ("Pirate havens that raid shipping and coasts until suppressed"; data/pirates.json): the Illyrians (until 168 BC), the Cretans (until 67 BC), the Cilicians (140-67 BC), the Barbary corsairs (1500-1830). A realm's customs fall by 30% of the share of its sea-route places within a haven's reach; coasts within reach lose 0.2% of their people a year. A haven is suppressed when its land is conquered or warships patrol within 200 km of it for six months.
- **Asked on the Ledger**: how your actions bend route shifts (your note), the number of merchants and what they do, other realms' treaties and embargoes, and how pirates are suppressed.
- **Later**: trade shown as moving lines thick by value, and visible caravans and fleets (the map's drawing); chartered companies (later ages).

Treasury and money: your follow-up answers (built, 1 Oct 2026)

Treasury > "Spending, coin and loans" opens the Finances panel.

- **Spending lines** ("You set each line"): court, temples and festivals, games, roads and works, grain; each 0% to 200% in steps of 25%. 100% is what a realm usually spends (court 10% of tax, temples 6%, games 4%, works 0.1 talent per 1,000 people, grain 4% of tax), so the old balance is kept; grain starts at 0%.
- Court: each step below 100% lets the rival's faction grow (4 points a year at 0%), above shrinks it.
- Temples and festivals: -5% unrest everywhere at 200%, +5% at 0%.
- Games: -3% / +3% unrest.
- Roads and works: growth (the burden factor +0.15 at 200%).
- Grain: -3% unrest and +0.1 growth per 100%.
- **Tax collectors** ("You choose tax farmers or salaried officials"). Officials: the usual administration cost; corruption takes its share. Farmers: pay 30% of a year's tax up front for a 5-year contract (it can't be broken sooner), keep 15% of what they collect, administration costs 60% of usual, corruption doesn't touch your taxes; +5% unrest and -0.2 growth.
- **The coin** ("You set the coin's silver content each year"): 30% to 100% silver. Prices move 15% of the way toward 1 / silver each year; all sums in your coin follow prices. Mint profit each year = tax x (1 / silver
- prices), large at first and fading as prices catch up. Customs fall with the silver ("Other realms value your coin by its real silver"). Rising prices add unrest (+10% per doubling). Restoring the coin costs (new - old) / new of a year's tax, at once.
- **Lenders** ("Several lenders, each with its own rate, limit and anger at default"): a shortfall is borrowed from the temples (6%, up to a year's income), then the bankers (12%, up to two years'). Surpluses repay the dearest first. Two years unable to pay or borrow and the realm **defaults** ("each lender reacts in its own way"): the temples' curse (+10% unrest and -0.3 growth for 10 years, your note: more than symbolic); the bankers refuse it for 30 years; realms it owed get a grievance (the "Unpaid debts" pretext for 20 years).
- **Lending to others** (Diplomacy > Lend): up to half your treasury, at most two years of their income, at 10%; they take it only when short of silver; they pay the interest and a tenth of the sum each year.
- **War indemnities** ("Yearly payments over many years"): a peace with tribute now sets an indemnity of two years of the loser's income, paid over ten years. Missing two years' payments, or you pressing "Stop paying", gives the winner the "Unpaid debts" pretext.
- **Money through the ages**: compared by silver until 1870, by gold until 1971, then by a basket of goods.
- **Retired remedies**: "Debase the coin" and "Sell the tax farms" left the emergency list; they are the coin and the collectors above.
- **Waiting for other topics**: who carries the tax (law and classes); the family purse (playing a family); officials stealing (events); banks, bonds and national debt (later ages); the full budget by province

with graphs (interface).

- **Not built yet, nothing in the way**: each realm's coin changing as history changed it; the long list of history's remedies, each only in the years it was used (your note). These need research into the sources first. (State monopolies are now built: see "Treasury and money: State monopolies" below.)

War: veterans as reserves (built, 16 Oct 2026)

Your answer "Veterans as reserves: yes, from their colony" (your note: "with consequences"), as Rome called back its evocati.

- A province remembers the veterans settled on it: how many, how hardened, and when. Each year at the plough they lose 2% of their edge, and after 25 years they are too old to march (fewer each year until then).
- The province's Land tab shows them, and "Call them back to arms" raises them as a new army of your people's heavy infantry at the colony, as hardened as they still are.
- The consequences: the colony resents losing its men from the fields (its grudge rises, so more unrest), and when they are discharged again they will want land again.
- Veteran colonies becoming cities of their own ("Either") waits for the cities themselves (Cities and settlements: Cities of their own).

Other realms: grudges, coalitions by history, a new ruler's temper (built, 16 Oct 2026)

Your answers "Grudges: yes, fading over generations", "Coalitions against you: by fear and history" and "New rulers, new policies: by the new ruler's traits" (your note: "any governing bodies and peoples making up those bodies change only a little, and have to be persuaded further").

- **Grudges.** A realm remembers wrongs done to it: a war declared on it (20), each province taken (10), a city plundered (15) or razed (30), up to 60 in all. The grudge comes off its opinion of you ("old wrongs not forgotten") and is half forgotten every 30 years. Saved with the game.
- **Coalitions by history.** As before, realms afraid of a conqueror band together; now history's rivals, and realms with a grudge of 10 or more, join when their opinion is -5 or worse (others need -20).
- **A new ruler's temper.** Each warm trait of a realm's ruler (kind, forgiving, just, generous, calm…) adds 3 to its view of every other realm, each cold one (ambitious, wrathful, cruel, vengeful, proud…) takes 3, up to ±15; when a ruler dies, the next one brings his own temper. Realms ruled by councils and assemblies (Rome, Carthage, Rhodes, Massalia, the Aetolians, Tarentum, Byzantium, Heraclea, Sparta) feel their leader's temper only 30% as much; this list will come from the kinds of government once you've checked that draft.

War: mercenaries: contracts, loyalty, elite bonuses, captains who seize land (built, 16 Oct 2026)

Your answers "Mercenary contracts: yes, months you choose", "Expensive companies: both", "Mercenary loyalty: yes, slowly" and "A captain taking a throne: yes, if unpaid or slighted".

- **Contracts.** You hire a company for 6, 12 or 24 months. Two months before it ends the chronicle warns you; "Sign on +6/+12/+24 mo" extends it for a month's pay. When it ends the company goes back to its hiring ground. Other realms at war sign theirs on again if they can pay a year.
- **Elite companies name their bonus.** As before, a strong company names a new monthly price each year within its range; now it also names its bonus after each victory anywhere in that range (for a 1.5×-3× company, between one and two months' pay).
- **Loyalty grows slowly.** Each month paid in full adds 1/60 (full after five years); each unpaid month takes away 15%. A loyal company is slower to desert, go over to the enemy or revolt (up to 70% less likely), asks more to be lured away, and while under contract and over half loyal can't be outbid at all.
- **Captains who seize land.** A captain owed three months, or one whose victory bonus went unpaid (slighted) and is still owed, and whose company is little bound to you (loyalty under 30%), may each month (8%) take the province his company stands in, as a mutinous general does.

War: generals grow (built, 15 Oct 2026)

Your answers: "Generals earn perks and skill from campaigns and victories", "A chance after each victory, fitting how he won" and "Tactics from battles, siegecraft from sieges, logistics from long marches".

- **Skill from what he does.** Each battle teaches tactics (0.5 of a point for a win, 0.3 for a defeat) and leadership (0.2); a battle at sea teaches seamanship instead of tactics. Each month before a city's walls teaches siegecraft (0.08), and each month marching beyond his own land teaches logistics (0.04). A point takes the skill divided by 5 in learning (from 5 to 6, a whole point), so the best come slowly. Skills learned this way stop at 10; perks and traditions can lift them higher.
- **Perks that fit the victory.** After a win there is a chance (a quarter, shared out over the perks he already has) of one that fits: horse master when cavalry or horse archers did most of the fighting, elephant master, skirmish leader for archers, slingers and light troops, drillmaster for heavy infantry; hill fighter, forest fighter, desert raider or river crosser for the ground; pursuer when the enemy lost over 40% of its men; sea captain at sea.
- **Green no longer.** A young commander's "green" perk goes after his third battle.
- Your own generals' lessons are written in the chronicle.
- **Waiting on your answers**: the full perk list (Generals' perks), how many perks a general holds (How many perks a general holds), and what exactly defeat teaches (What defeat teaches, in detail).

Treasury and money: State monopolies (built, 15 Oct 2026)

Your answers: "Declare monopolies on goods", "Both, chosen for each good" and "History's list, plus any other at a higher cost".

- **History's monopolies** (data/monopolies.json, each with its source): the Ptolemies' oil (olive and sesame), papyrus, linen, beer, salt and natron (the Revenue Laws of Ptolemy II, 259 BC, and the Tebtunis papyri); Rome's salt from 204 BC (Livy 29.37); the Seleucid salt tax (1 Maccabees 10.29); the Hadramite frankincense road (Pliny 12.63); and for later ages Justinian's silk, the Han salt and iron, Venice's salt office, the French gabelle, the Spanish tobacco estanco and the Bengal opium monopoly. Realms begin with the ones history gave them at the start date, so Egypt starts with all of the Ptolemies'.
- **Claiming one**: in Finances, pick any good your land makes (history's for your realm and age are starred) and choose who runs it.
- *Royal officials* take half the value of the good your land makes (the Ptolemies bought oil cheap and sold it at about twice the price), less what corruption steals.
- *Contractors* pay 35%, steadily, and corruption doesn't touch it.
- You can switch each monopoly between the two at any time.
- **What it costs**: each of history's monopolies adds 1% unrest across the realm. Any other adds 3%, or 9% on a good people buy every day (grain, bread, oil for the lamp), and merchants trade less with you: customs fall 4% for each.
- **Egypt's tax reach** was ×1.8 to stand in for its monopolies; it is now ×1.35, and the monopolies (about 2,600 talents a year) make up the rest.
- **Waiting on your answers** (new questions on the Ledger): who sets a monopoly's price, smuggling, ending a monopoly, and whether other realms claim history's monopolies on their dates.

Units of their own, the roster, and War: manpower (built, 1 Oct 2026)

Your answers: units of any size (you set 100 to 5,000 men), merging and splitting; armies hold an even number of units and splits make even numbers; experience averaged by men when units merge; a roster with each unit's strength, experience and origin; units raised where their people are; the dead are lost to the population, taken from the provinces the units were raised in; the wounded separate from the dead.

- **A unit** has a type, 100 to 5,000 men, its own experience (0 raw to 1 hardened), the province it was raised in, and its wounded. A new unit is its type's usual size (1,000 foot, 500 horse…).
- **Splitting** halves a unit (both halves at least 100 men). **Merging** joins two units of one kind (at most 5,000 men), experience averaged by men.
- **An even number of units.** After any change (recruiting, losses, disbanding, your own split or merge) the game splits the army's largest unit in two, or merges its two smallest of one kind, so the count stays even. A split or merge by you therefore changes the count by two. No men are lost or gained by this.
- **Losses** take a share of each unit's men. Of a beaten army's losses half die (the slaughter of the rout), of a victor's a quarter; the rest are wounded. Men lost with sunken ships, to hunger or to the sickness of siege camps mostly die (80%, 80%, 60%).
- **The wounded** heal: each month a quarter of them return to their unit and 3% die of their wounds.
- **The dead** leave their home province's people at the end of the month (spread over its towns and villages by their size); dead with no recorded home come from the capital province.
- **Where units are raised**: the province the army stands in, if it is yours; otherwise your capital's province. (Marching recruits to their army and training time wait on "Recruits marching to the army" and "Training time".)
- **Remnants** under 100 men join another unit of their kind, or go home.
- **The roster** (Armies panel): one line per unit with its men, wounded, experience and home, and Split, Merge and Send home.
- **Mercenary companies** hold units too, which keep their men and experience from employer to employer.
- **Unpaid desertion** takes men from every unit (it used to take whole units).
- **Who serves** ("a share per culture from history") waits on social classes; the levy share by free, dependent and enslaved people stays.
- **Speed tripwire** (your choice): the test of other realms fails if a year's calculations pass 1 second. It was 600 ms, a number I chose myself. When it trips, the code is made faster or you raise it; it is never a reason to cut simulation.
- **Speed**: supply distances are now worked out once a year per realm (borders change only when sieges end or peace is made), which brought a year from about 600 to 435 ms in the test of other realms.

Technology and knowledge: your follow-up answers (built, 30 Sep 2026)

Your answers on the Ledger's "Technology and knowledge" topic.

- **Research by branch** ("Researching several at once": a share of effort for each branch). Each of the 15 branches studies its own technology. You set each branch's effort with a slider (0 to 10) in the Research panel; the year's points are shared out in proportion. A branch at 0 gathers nothing. Other realms put all their effort into one branch at a time, the one with the cheapest open technology.
- **How far ahead of history** (open about 50 years early, dearer the earlier). A technology opens 50 years before the year the world knew it. At the earliest it costs 3 times its price, falling evenly to its price in its own year.
- **Learning from neighbours** (cheaper when neighbours and trade partners know it). A realm's contacts are the realms it borders and those on a trade route with it, not at war. A technology every contact knows costs 40% less (a share of them, a share of that).
- **Where research comes from** (towns, libraries, schools, great people, trade contacts). Each contact adds 4% research, up to 40%. Your note (education is a large part; people listed by education) waits on social classes (Population and people).
- **Inventions from beyond the map** (arrive on history's dates, spread along trade, researched after arrival). Paper (AD 750, by Samarkand), silk-weaving (AD 550), the stirrup (AD 600, with the Avars), gunpowder (AD 1250, with the Mongols) and the magnetic compass (AD 1190, by the Indian Ocean) can be studied only after their date, and only by a realm holding a region they enter by (Hyrcania, Media, Persis, Scythia, Pannonia, Arabia Felix) or bordering or trading with a realm that knows them.
- **Who knows a tech** (each region knows it; conquest brings what they knew). Taking a province teaches the conqueror some of what its old master knew: each technology the loser knew whose prerequisites the conqueror has, with a chance of twice the share of the loser's people taken (5% to 60%). The chronicle names what was learnt.
- **Pace** (near history's pace; leaders a few decades ahead). Old knowledge gets cheaper as it spreads: a technology costs up to 50% less, reached 200 years after its date. All research is scaled by 1.5, set by a 100-year run from 300 BC: by 200 BC Egypt (the leader) knew 77 of the 78 technologies the world knew and had one ahead of its time; Carthage 53, the Seleucids 39, the Gauls 23.
- **Waiting for other systems**: knowledge lost when cities fall and literacy drops, and found again only as derivatives unless history truly recovered them (your note) — needs literacy (Population and people); great movements spreading like religions — needs Culture and religion; spies stealing techs — needs Diplomacy; the tree's look ("Both") — a tree and a timeline view, with the interface work.

Provinces, part one (built, 11 Oct 2026)

From your answers on the Ledger (A province's focus, Province focuses, Each province's seat, Redrawing your provinces, More province tabs):

- **A province's focus** (Land tab): farming (fields and orchards +10%), herding (herds +15%), mining (mines and pits +15%), crafts (its share of the realm's made goods +10%), trade (+10% of its share of trade) or soldiers (+15% of its share of levies). Every other kind of land work yields 5% less at full, as hands move over. A focus takes hold a tenth a year, ten years to full; changing it starts again; a new ruler drops it.
- **Seats** (`data/province_seats.json`, 166 of 245): each province's historical seat about 300 BC (Latium: Roma, Campania: Capua), shown under its people; where history gives none, or the seat lies outside a province you made, its largest town.
- **Splitting and joining**: "Split" cuts one of your provinces in two across its longest side (the new half is named after its largest town); "Join with…" joins a bordering province of yours into it, keeping the better of each building. Both cost loyalty for a while (+20% unrest).
- **A province's history** (History tab): what happened there, newest first: who held it, sieges, battles, disasters with their dead, buildings and wonders finished, revolts, its focus.
- **Province graphs** (top of the History tab): its people, unrest and integration year by year (400 years kept; older years thinned to every tenth).
- Still to come in Provinces: governors over groups of provinces (they need characters), province kinds (core, conquered, allied city, client kingdom, temple-state, colony, frontier march), history redrawing other realms' provinces, the and the Economy and People tabs.

The Bronze Age and the opening

(decided in part, 11 Oct 2026)

Your wish (11 Oct 2026): to play in the Bronze Age, above all the collapse, Ugarit, the Hittites and the Hattians. Your answer on how the game begins:

> The beginning should be a simulation/history lesson that spans the earliest gatherings of people for one purpose such as Göbekli Tepe, and then go through the early settlements like Çatalhöyük, then starting the game at the point settlements became polities. It should be like a cutscene.

Questions waiting on the Ledger (topic "The Bronze Age"): How the Bronze Age fits in; When settlements become polities; What the opening shows; Watching the opening; Is the opening simulated?; How the collapse plays; What makes the Bronze Age different; When to build the Bronze Age.

The opening (built, 13 Oct 2026)

From your answers What the opening shows (the map coming to life, and each place can be opened), Watching the opening (plays by itself, and you can pause, slow it down or speed it up) and Is the opening simulated?:

- **When**: a new game begins with it, before you choose your realm. Skip at any time (Skip, or Esc); Settings, Gameplay, "Show the opening" turns it off.
- **The years** run from 10,000 BC to 300 BC across the map, in seven chapters, one for each of the bard's scenes (Göbekli Tepe, the first grain and Jericho, Çatalhöyük, the rivers and Eridu, Uruk, the first states, and the bridge to 300 BC). Each chapter begins with its year read aloud, then the scene; the clock runs while it is told and the view moves to where the story is (the hills of the Fertile Crescent first, the whole map by the end). It lasts about five minutes.
- **People** spread and multiply as HYDE 3.2.1 has them, one picture every thousand years (`data/opening/pop_<year>.png`, made by `tools/build_opening_population.py`), blended as steady growth in between: hunters barely show, farmland glows, towns and cities shine. The last picture is the game's own 300 BC population, so the opening hands over exactly the world you then play.
- **The places**: 38 ancient sites (`data/opening.json`) light up in their years, their names showing for a while. Click one (the years pause) to read and hear its story; Continue, and the bard says "And so the years run on" and picks up where he stopped.
- **Photographs** (your answer to Pictures for the opening's places, 13 Oct 2026: free photos): 36 of the 38 places show one, the site or a find from it, with the photographer and licence beneath. Only licences that allow any use, commercial included: public domain, CC0, CC BY or CC BY-SA. All from Wikimedia Commons (`tools/fetch_opening_photos.py`; full credits in

`assets/opening/sites/CREDITS.md`). Hacılar and Hamoukar have no free photograph anywhere yet; they show their words alone.

- **The step of the story** (18 of them, from the hunters to the first states) shows under the year; "Tell me" pauses and reads it out.
- **Controls**: Pause (Space), Slower (half speed), Faster (two or four times; the bard is cut short when the next scene begins), Skip. At half speed there is time between scenes, and the bard reads the thousands of years as the clock passes them.
- **The first time** you watch it, the bard explains the controls before the years begin.
- **Narrators off** (Settings, Audio): the words stay on screen for as long as they would take to say.
- **Not yet**: the game's own population and farming engine running the opening, rather than HYDE's record (your answer to Is the opening simulated?, kept for when the engine can start before 300 BC); ending at 3500 BC instead of 300 BC, when the Bronze Age start (your answer to When settlements become polities) is built.

Buildings and works, part three: roads (built, 11 Oct 2026)

From your answers on the Ledger (How roads are drawn, Kinds of road, What roads do, Roads others build, Which kinds of road, What a road costs, Enemies on your roads):

- **Kinds by material** (`data/roads.json`), each faster and carrying more: earth road, gravel road, paved stone road (needs Surveying with the groma), macadam road (Macadam roads, 1820) and asphalt road (Motorways, 1930). Railways are not roads and come with their own network later.
- **Drawing one**: in a province's Buildings tab, pick a kind under "Draw a road", click one of your towns, then another. The road finds the easiest ground through your own land. A bar shows its length, bridges, silver, workers, years and upkeep, with Build and Cancel; right-click stops drawing.
- **Cost**: silver per km (more over rough ground) plus each bridge; workers per km taken from manpower while it is built; years at 100 km a year, up to four times faster as the realm learns transport and construction (your note on finding a formula for building faster through the ages); upkeep each year of 1% of its price.
- **What roads do**: everyone marches faster on them, invaders too (a paved road halves the ground's cost whatever the ground); the provinces they cross trade more; a road all the way to the capital takes much of the far-province penalty away; ideas travel along them (up to +10% research at 5,000 km of road). Disease travelling along roads waits on "Epidemics that travel" (Population and people).
- **Breaking your own**: each of your roads has a Break button (it speeds no one) and Repair (a quarter of its price, a year).
- **Neglect**: three years of unpaid upkeep and a road falls a kind (paved to gravel to earth to nothing).
- **History's roads** (`data/roads_history.json`, 26): those older than 300 BC stand at the start (the Royal Road, the Via Latina, Via Appia and Via Valeria); later ones are laid by their builders on their dates, a leg at a time where they hold both ends (Rome's viae, the Via Egnatia, Trajan's roads). Railways among them wait for the railway network.

Buildings and works, part three: canals, great works and frontier walls (built, 11 Oct 2026)

From your answers (Canals and great works, Which canals and great works, Great works others build, Frontier walls, How frontier walls are drawn, What frontier walls do, History's frontier walls):

- **History's canals and great works** (`data/works_history.json`, 15) are built as wonders are: each once in the world, history's builder (or whoever holds the place) begins it on its date, you can race them from that date, hurry them, and they fall on history's dates (the Canal of the Pharaohs silting up). They give realm effects: the canals trade and cheaper sailing (Suez +15% trade, -10% sea travel), the drains and dams more field crops (the Fucine Lake +3%, the Aswan High Dam +8%). The Diolkos of Corinth stands in 300 BC. They are listed with the wonders in a province's Buildings tab.
- **Canals you dig** (`data/roads.json`, "canals"): pick a kind under "Dig a canal", click your land by the sea or a river, then by another water. Without the pound lock (1373) a canal can't climb hills; with it, a canal with locks can; Great ship canals (1869) open the ship canal. A canal costs silver, workers and years like a road, brings trade to the provinces it crosses, and your ships sail through it. Unkept, it silts up.
- **Frontier walls you draw** (`data/roads.json`, "walls"): ditch and rampart, or stone wall. Pick one under "Draw a frontier wall", click your land where it starts and keep clicking along your border; each click adds a stretch, then Build. Once finished it takes its garrison from manpower (25 or 40 men a km); unmanned it decays in three years. Armies of another realm (not an ally) lose 40 or 90 km of march for each crossing; provinces along it are better held (garrison +1 or +2). Stopping raids waits on raiding (the campaign question "Raids").
- **History's walls**: the Long Walls of Athens stand in 300 BC and fall to Sulla in 86 BC; Rome builds the Fossatum Africae, the Strata Diocletiana, the Hexamilion and the Anastasian Wall on their dates where it holds both ends. Walls whose builders aren't realms of the game (Gorgan, Derbent) aren't built by others (your answer: only their own history's).

Your answers of 11 October 2026 (recorded)

92 answers from the Ledger. Built so far: the three wonder answers and the pirates' (below); the rest wait on their systems (see ROADMAP.md).

Buildings and works

- **Which canals and great works**: History's own plus any canal you draw between two waters.
- **Great works others build**: Yes, as wonders: only their own history's, and you can race them.
- **What a road costs**: Also workers taken from manpower, like wonders. Your note: "need to find formula for lessening time it takes as eras/years progress"
- **Enemies on your roads**: Everyone, but you can break your own roads to slow an invader.
- **Which kinds of road**: your own answer. Your note: "railway is not a road, and they should primarily be split by material and hence speed and bandwidth"
- **How frontier walls are drawn**: Click point to point along your border; cost by length and ground.
- **What frontier walls do**: Stop raids, slow armies crossing; need a garrison from manpower or they decay.
- **History's frontier walls**: Yes, only their own history's.
- **Hurrying a wonder**: More silver and workers make it faster. Your note: "Up to a quarter faster at triple the cost"
- **Wonders whose builders aren't in the game**: Whoever holds the place builds it on history's date.
- **Saving a wonder from its fall**: Ask me each time.

Cities and settlements

- **Moving the capital, in detail**: Also: administrative reach centres on the new capital at once.
- **What holds a city back, in detail**: Each city has a water limit (aqueducts raise it), a food limit (what its land and trade bring in) and disease that grows with size (baths and sewers lower it).
- **Choosing spare, plunder or raze**: Spare: loyalty; plunder: silver and slaves, buildings damaged; raze: the city becomes a ruin and others fear you.
- **City tiers**: your own answer. Your note: "At least 15 tiers"

Sacking and ruins (built 15 Oct 2026)

Your answers "Spare, plunder or raze" and "Destroyed cities". Each siege carries a choice for when the place falls, set in the Armies panel beside the siege (plunder unless you change it); other realms choose for themselves: they spare their own people and cities they lost before, raze about 3 in 100, and otherwise plunder (`src/Game/Sacking.cs`).

- **Spare**: no loot, no captives, nothing burned; the province starts 0.3 more integrated under you.

- **Plunder**: loot of about a year of its taxes (1.5 talents per 1,000 people), the usual captives, 3% of its people killed, buildings damaged as before, and a grudge (0.25 unrest) that fades by 15% a year.
- **Raze**: the same loot, three times the captives, a quarter of its people killed, every building burned, its land laid waste (ravaged in full, see War's toll on growth), a grudge of 0.4, and 8 more aggression; other cities fear you, so your sieges go 25% faster for twenty years. The seat becomes a ruin, named in its province's Land tab.
- **Resettling a ruin**: 150 talents and 2,000 men sent as settlers (as Caesar refounded Carthage); the ruin is gone and the grudge halves.

Moving the capital (built 15 Oct 2026)

Your answers "Allowed at a cost of years, silver and loyalty" and "Administrative reach centres on the new capital at once" (`src/Game/CapitalMove.cs`). In one of your provinces' Land tab, "Make (its seat) your capital" costs 100 talents plus 0.2 per 1,000 of your people (Rome, about 900,000 people: 280), paid at once. Five years later the court arrives (Constantine took six over Constantinople): the capital star and administrative reach (distance, roads to the capital) move to the new seat at once; the old capital holds a grudge (0.3 unrest, fading), and the court's old families take it badly (the rival faction grows 15). Lose the province before then and the move and its silver are lost. Other realms keep history's capitals for now.

Still to come in Cities and settlements: cities as their own things inside provinces with sizes and tiers, their water, food and disease limits, slots by size, colonies, the mob and free cities. Those wait on towns and countryside being split (your answer "Each province splits into its towns and its countryside").

Diplomacy

- **Client kings**: Clients keep their ruler and laws, pay tribute or troops; you can install or remove kings.
- **Demands and insults**: Send demands and insults.
- **How envoys work**: Envoys are characters who travel for weeks or months; their skill matters; you have a few.
- **Hostages**: Hostages guarantee treaties and learn your ways.
- **International bodies**: They appear as history had them and can bind members.
- **Leagues**: Members, a leader and votes on war; you can join, lead or break them.
- **Making peace**: Build a treaty from items the other side weighs.
- **Pretexts by era**: A full list by era.
- **Who you can deal with**: Only realms you know, widening with contacts and trade.
- **More kinds of treaty**: Non-aggression, military access, trade, subsidy, marriage alliance, hostage exchange, federation (foedus), defensive league.
- **Paying off invaders**: Pay tribute to buy peace from raiders.
- **Trust and fear**: Separate trust (do you keep your word) and fear (your might and aggression).
- **What can be given**: Silver, goods, famous objects, land, and help (troops, grain).
- **Protectorates**: You guarantee a realm's independence and may intervene in its affairs.

Government, laws and administration

- **Which estates**: By realm and era: Senate and equites, priests, army, cities, nobles, merchants, peasants.
- **The kinds of government**: Yes, once I've checked the draft.
- **How a law passes**: Each law costs some of the four points as well as time and silver.
- **What the points buy**: Authority: laws and reforms; Piety: religious acts; Loyalty: holding estates and armies; Legitimacy: succession and claims. Your note: "some are multifaceted"

Land, resources and goods

- **Adopting new crops**: A crop arrives by trade on history's date; you pay to spread it province by province. Your note: "Non-player realms adopt them whenever they historically do, if they never do historically then they don't in the game."
- **History's named mines**: About 30 of the great ones.
- **Prospecting**: Pay to survey a province once the technology is known; history's finds come on their dates for everyone.
- **How stores work**: Also sold when prices are high, by your order.

Population and people

- **Which social classes**: Nobles, priests, citizens, freedmen, peasants, slaves, foreigners, changing by era and culture.
- **What each class wants**: Each class needs a basket of goods; going short angers it.
- **How literacy rises**: Schools, libraries, towns, printing, religion; it falls in war and collapse.
- **Towns and countryside**: Towns from history's sizes (Rome about 300,000 by 1 BC), the rest countryside; people move to towns that have work.

Provinces

- **Province focuses**: Farming, herding, crafts, trade, mining, soldiers.
- **Choosing governors**: Characters you appoint; their skills change taxes, unrest and corruption; they may grow too strong.
- **The province kinds**: Core, conquered, allied city, client kingdom, temple-state, colony, frontier march.
- **Redrawing your provinces**: Split or join provinces in the province panel, at a cost of loyalty for a while.

Sound and music

- **Ambient sound**: Sounds of what's under the camera: sea, market, wind on the steppe.
- **Sound effects**: Clicks, coins, marching, battle, sea, crowds, varied by era.

- **How music is chosen**: By situation, culture and era, crossfading.
- **Separate volumes**: Music, effects and ambient apart.

The court: characters and families

- **What councillors do**: You give each a task (collect taxes, watch the court, win a people over) and their skill decides it.
- **Councillors' own will**: They have opinions, ambitions and may resign or plot.
- **The court screen**: A hall with the ruler, family, council and courtiers as coins.
- **Personal unions**: The junior realm keeps its laws and may break away when no common heir remains.
- **Marriages and treaties**: A royal marriage can seal an alliance, but doesn't make one by itself. Your note: "can be chosen as a law to automatically make an alliance"
- **Marrying across faiths and peoples**: By each culture's and era's rules.
- **Marriage offers**: Other courts send offers you can accept or refuse.
- **What a family controls**: Only what its members hold: offices, armies they command, their estates. Your note: "if a member holds a title to rule, the family is named as the ruling family and all close members holds the "royal" trait instead of their "noble" trait"
- **Family life when playing the realm**: The ruling family's events still reach you.
- **Switching mid-game**: You can switch between realm and family. Your note: "Let's find the best way to do this"
- **Finding plots**: The spymaster and loyal friends uncover plots; you learn the plotters.
- **Plots abroad**: Plot against foreign rulers and courts.
- **Punishing plotters**: Pardon, exile, imprison, execute, each with consequences. Your note: "at least 2 more options such as enslave or send to colosseum"
- **Who gets a portrait**: Everyone at court.
- **Ambitious regents**: A regent may try to keep power or take the throne.
- **Which magistrates**: Each republic's own offices and ladder of office.
- **Governors in republics**: Former magistrates govern provinces.
- **The Senate and the assemblies**: A senate and assemblies that vote on war, laws and commands.
- **Skills through life**: Skills grow with age, education and office, fade in old age.
- **How skills are shown**: Both. Your note: "use creative words and 1-100"
- **Co-rulers**: Raise an heir to co-ruler.
- **Disputed successions**: Rival claimants can start a war of succession.
- **Succession laws**: History's laws by culture: eldest son, any son chosen, brother first, elective, tanistry, shared kingdom.
- **Traits changing**: Traits come and go with life's events.

- **The family tree**: Filters: living, heirs, claimants, marriages; click to open anyone.

The map

- **Which coasts change**: Also drainage and reclamation you build.
- **The whole globe: order**: India, then Central Asia and China, then Africa, then the Americas.
- **What the map editor edits**: Borders, provinces, towns, names, starting realms.
- **Passes, fords and straits, in detail**: Armies must use them to cross mountains, rivers and straits; holding one blocks it; winter closes passes.

Time and turns

- **Finer time**: Months are fine. Your note: "add weeks"
- **What stops time**: A list in Settings where you tick what stops time.
- **Years per turn with the clock**: Keep both: the clock and the turn button.

Trade

- **Other realms' trade treaties and embargoes**: Yes, history's treaties on their dates, and their own by their aims.
- **How many merchants**: Both.
- **What a merchant earns**: your own answer. Your note: "Silver, Steer goods & bring news"
- **Suppressing pirates**: Need enough warships. Your note: "Suppressed havens return later also"
- **How your actions alter route shifts**: Both.

War: armies, units and generals

- **Which laws decide standing troops**: A number per realm from history (start_realms.json).

War: mercenaries

- **Captains who rise, in detail**: To a lordship or a throne, if they hold land and their men are loyal.

War: reforms

- **What makes a reform available**: History's causes plus a technology.
- **Who is angered by reforms**: Your rival's strength rises.
- **Which army reforms first**: Every reform we can source to 1 AD.
- **Refusing a reform**: You can take it later from a reforms list.

Built from these answers (11 Oct 2026)

- **Hurrying a wonder**: a wonder can be built up to a quarter faster at up to three times the silver and workers (the province panel offers a hurried button).

- **Wonders whose builders aren't in the game**: whoever holds the place begins it on history's date (up to 50 years late), with the goods it needs.
- **Saving a wonder from its fall**: when history's date comes, an offer appears in Diplomacy; the wonder stands while you decide. Accepting pays half its price and it stands for good; declining, or leaving the offer for two years, lets it fall.
- **Suppressing pirates**: each haven has a naval strength (Illyrians and Cretans 4, Cilicians 8, Barbary corsairs 10) that grows 1% a year unchecked, up to three times. Patrol months count only when your warships in reach are at least as strong. A suppressed haven returns 40 years later unless the realm holding its coast keeps warships there at least as strong as the pirates first were.

Buildings and works, part one (built, 4 Oct 2026)

From the designer's answers on the Ledger (Buildings and works):

- **Many buildings** (`data/buildings.json`, 80): the first twelve, one building for nearly every good (olive groves, potteries, vineyards, dye works and so on; each raises its good in the province by a share per level), and warehouses (spoilage), libraries and schools (research), baths, theatres, a mint and an agora.
- **Levels**: each building has named levels (harbour, then great harbour); level n costs n times the base price and takes the same years.
- **Queue**: up to 6 works waiting per province. One is built at a time; a town of 50,000 builds two at once, of 200,000 three.
- **Decay**: when upkeep goes unpaid for 3 years in a row, one building in each province loses a level; a province of under 1,000 people lets its buildings fall too.
- **War damage**: a province taken by siege loses a level of its walls, and each other building has a 30% chance to lose one; the chronicle says so.

Buildings and works, part two: wonders (built, 4 Oct 2026)

From the designer's answers on the Ledger (Buildings and works: which great works count as wonders, wonders others build, wonders destroyed, building a wonder, what wonders do):

- **The list** (`data/wonders.json`, 38): the Seven Wonders and wonders through the ages, from the Pharos and the Library of Alexandria to the Pantheon, Hagia Sophia, the Dome of the Rock, Notre-Dame, St Peter's, Versailles and the Eiffel Tower. Each has its real place, history's dates, its builder, cost, workers, special goods and effect.
- **Once in the world.** The Great Pyramid, the Hanging Gardens, the Temple of Artemis, the Statue of Zeus and the Mausoleum already stand in 300 BC.
- **No one before history.** Nobody can begin a wonder before the year history began it.
- **History's builders.** The realm that built it in history begins it on that date if it holds the place and has the special goods (up to 50 years late), and takes history's years. Other realms build only their own history's wonders. A wonder whose builder isn't a realm of the game (the Dome of the Rock) is left for you.
- **You race them.** From history's date you can begin any wonder in any of your provinces (a coast where it needs one). Whoever finishes first has it; the others' work stops, their workers come home and half their silver comes back. You can build several.
- **The cost**: silver, workers taken from your manpower while it is built (5% never come back), and special goods your realm must make or import (marble, granite, papyrus, bronze…). Work halts under siege and stops if the province is lost.
- **Effects** go to whoever holds the province: the Pharos makes sea travel cheaper, the Library brings a quarter more research, the Colosseum calms the people, Versailles lets the court manage more provinces. Each adds its culture to the score.
- **Falls.** Wonders fall on history's dates (the Colossus in 226 BC, the Temple of Artemis to the Goths in AD 262). Only yours can be saved: when the date comes you are asked in Diplomacy whether to save it for half its price (changed 11 Oct 2026, your answer "Ask me each time").

Battles and generals, part 4a: mercenary companies (built, 28 Sep 2026)

Your answers: companies replace "hire at twice the price"; history's companies in their eras plus generated ones; hired at hiring grounds (be near or send an envoy); 500 to 5,000 men of mixed arms; each captain a character; monthly pay plus a bonus after victories, strong companies with a price range that can bankrupt you; unpaid they desert, change sides or revolt; they go to whoever pays best. Each unit keeps its own experience.

- **Hiring grounds** (data/mercenaries.json): Cape Taenarum, Crete, Rhodes, the Balearics, Thrace, Galatia, the Alpine Celts, Celtiberia, Numidia, Libya, Messana, Illyria, Aetolia, Thessaly, Olbia, Tanais, Arabia, Persis.
- **Companies.** 22 from history, each in its years (Xanthippus' Spartans 257-250 BC, the Gaesatae 236-222 BC, the Mamertines 289-264 BC…). Each year there is a 30% chance a company is raised at a ground with none waiting, from the peoples there; it waits 6 years and then disbands.
- **Hiring.** Armies > "Mercenary companies". Within about 40 map steps (360 km) of your land or one of your armies you pay the first month; from afar an envoy costs one more month. The company becomes an army at its ground, led by its captain.
- **Pay.** Each month: the troops' own yearly cost ÷ 12 × the company's factor (1.3-1.5 for ordinary companies; elite ones name a new price each year inside their range, e.g. Xanthippus 1.6-3.5). Each victory adds 1-2 months' pay owed. Mercenaries are not in the army's upkeep; the treasury panel shows their year's pay as its own line.
- **Unpaid.** Owed 2+ months: a 15% chance each month they desert. Owed 4+ months: a 35% chance they go over to your richest enemy, or revolt, plunder up to 6 months' pay and march away.
- **Outbidding.** Offer 1.25× their pay (with two months' pay in hand) and a company leaves its employer for you, keeping its experience.
- **Other realms** at war hire the largest company near them if they can afford a year of it.
- **Recruiting your own** now always takes manpower; without enough men you are told to hire a company instead.
- **Experience by unit type.** New recruits dilute only their own kind of unit; the veterans beside them keep their edge.
- Fleets' commanders are shown as admirals, companies' as captains.

Dynasties and characters (decided, built)

in short

Ruling families live, marry, have children and die. The crown passes by real inheritance rules, and a new house takes over when a line dies out or a throne is seized. Built and in the game.

People: skills, traits, faith, blood, reputation and bonds (built, 14 Oct 2026)

From your answers Which skills, Traits (your note: at least 250), How skills are shown (your note: creative words and 1-100), Skills through life, How characters die, What characters think of each other, and your wish of 14 Oct 2026 for four more kinds of trait (faith and philosophy, bloodline, reputation, relationships):

- **Twelve skills**, shown 1-100 with words of their own (Oratory runs from "Mumbling" to "Golden-tongued"; Tactics from "Lambs to the slaughter" to "A new Alexander"): statecraft, stewardship, diplomacy, intrigue, learning, piety, oratory, and the five war skills a general has (tactics, leadership, siegecraft, logistics, seamanship). 50 is an ordinary grown person. Half comes from the parents, half is one's own. Children have only part of their skills until sixteen; the body's skills fade from sixty, the others from seventy, while learning, statecraft and piety hold. A family member who takes command brings his own war skills.
- **350 traits** (`data/traits.json`, which you can edit): personality (83, mostly in opposed pairs), schooling (48: twelve skills, four grades), pastimes (50), body (35, inherited), health (30), deeds (44), faith and philosophy (33), bloodline (16), reputation (11). Each adds to skills; many change the realm while their holder rules; health traits shorten or lengthen life; some change how many children come.
- **Growing up**: three traits of nature at birth; body and health traits run in families; schooling ends at sixteen in the skill they were best at, graded by how good they were, often taught by a kinsman (a mentor bond); half take up a pastime. Illnesses come with age (gout, a weak heart…), infirmity after 65. Deeds add traits: a family general who wins three battles is a victor, eight a famed commander.
- **Faith**: everyone worships the gods of their family, or else of their people (the Olympians, Baal and Tanit, Ahura Mazda, the druids' gods…). Some take up a mystery cult (Isis, Serapis, Eleusis, Samothrace…) or, if learned, a school of philosophy (the Stoa, Epicurus, the Academy…). Other gods lower opinions; zealots more, the tolerant not at all.
- **Bloodline**: royal blood from a reigning parent; "of two peoples" from mixed parents; the great houses' claims: the Seleucids from Apollo, the Ptolemies from Heracles and Dionysus, the Spartan kings from Heracles, the kings of Epirus from Achilles, Pontus, Armenia and Cappadocia from the Persian kings. New houses start as "new men".
- **Reputation**: each year a ruler's deeds and nature decide what the world says of them: notorious, hated, feared, famed, beloved, honoured, mocked, called the wise, known for piety, respected, or little known. Strangers think better or worse of them for it.

- **Bonds** with named people: friend, rival, lover, mentor and student, sworn brother, nemesis. They form at court over the years by how well natures fit (shared traits, faith and people; opposed traits; two ambitious men rarely get on); rivals who come to hate each other become nemeses.
- **How people die**: old age, disease, accident (hunters and riders more), childbirth (about one birth in seventy, more for hard births and mothers over 35), battle; execution and murder come with plots.
- **Named deaths** (your list of 14 Oct 2026, `data/deaths.json`, 96 entries): 42 diseases and 50 accidents, plus four ways to die of old age, each in the words of its age. Tuberculosis is "the wasting sickness", then "consumption" from 1300, "tuberculosis" from 1882; malaria "a fever of the marshes", then "the ague"; any pestilence "the plague". Some only for certain people: hunters are gored by boars and mauled by lions, charioteers overturned at the races, drunkards die of ruined livers or drown in vats of wine; only the rich and vain bathe in gold; mercury for the great pox only after 1495. History's own odd ends are there: Pyrrhus's roof tile, Aeschylus's tortoise, Chrysippus laughing at his own joke, Henry I's lampreys, Tycho Brahe's bladder.
- **Opinions** with their reasons: family, shared and opposed natures, people, faith, philosophy, how the other rules, reputation, looks, bonds and memories (old wrongs fade after twenty years).
- **The ruler's effect on the realm**: each point of stewardship above an ordinary 50 adds taxes, learning research, statecraft integration and less corruption, oratory and piety calm, siegecraft faster sieges, logistics reach, leadership men; plus the ruler's traits (a cruel ruler stirs unrest, a just one calms it).
- **The person's panel**: click the ruler or heir at the top. Skills, traits by kind (hover for what each does), family and bonds (click any name), and what they and your ruler think of each other, with reasons. Hovering the ruler or heir shows a short card.

Depth for now: enough for ruling families to live, marry, have children and succeed each other for the whole game, without traits, events or intrigue (those can be layered on later). Code: `src/Dynasties/` (`CharacterRegistry.cs` for succession and mortality, `CharacterRegistry.Life.cs` for the yearly simulation, `Names.cs`), the 300 BC families in `MapView.RealCivs` / `FrontierZones`. Tests: `DynastyTest`, `DynastyLifeTest`, `TimeTest`.

- **Starting families.** Each realm starts with its real (or, where the record is thin, plausible) 300 BC ruling family with real ages: Antigonos the One-Eyed at 82 with his son Demetrios and grandson Antigonos Gonatas, Ptolemaios I at 67 with Berenike and their children, Seleukos with Antiochos, and so on. Rome, a republic, is represented by its leading house (the Valerii). Rulers range from 38 to 82.
- **Cultures.** Every realm and character has one of eight naming traditions (Latin, Punic, Greek, Meroitic, Nabataean, Iberian, Celtic, Scythian). Children take the culture of the parent whose house they belong to; a first son is sometimes named for his paternal grandfather and a first daughter for her maternal grandmother.
- **Mortality.** A pre-modern elite life table: 8% die in the first year, about one in six before five, 0.8% a year from 15 to 39, then a rise from 1% at 40 doubling about every nine years (cap 35%). About 63% of 40-year-olds reach 60 and a third reach 70. Average reign comes out around 26 years.

- **The court.** Only each realm's court marries and has children: the ruler, spouse, children and grandchildren, siblings with their children, and the heir's household. Everyone else lives out their life but the family tree stops branching there, which keeps the world to a few hundred living people however long the game runs.
- **Marriage.** Unmarried court members (men 17-55, women 15-38) marry with a 35% chance a year; three in ten matches are with another realm's court (the closest in age within 15 years, from another house), the rest with a generated noble of the realm's culture.
- **Births.** A married woman of 16-42 has a child with a chance of 24% a year in her twenties, falling to 3% after 40; at most nine children. About four or five births per full marriage.
- **Succession.** Primogeniture with representation: the ruler's descendants in order, the eldest line first, so a dead eldest son's children come before his younger brother (under male preference, sons' lines before daughters' at every level). With no descendants, the search moves up: brothers and nephews, then uncles and cousins, up to four generations. A princess who married outside the great houses keeps her children in her house and line. **No personal unions:** someone already reigning elsewhere is passed over, so realms never merge by inheritance (a later decision could allow it).
- **New houses.** A realm gets a new ruling house when its family has died out, or when a strongman seizes the throne at a succession: 6% at every succession, plus 25% when the heir is a child under 16, plus 10% when the heir isn't the late ruler's own descendant. The founder (30-50, of the realm's culture) comes with a wife and children. Over two thousand years, houses last about 280 years on average.
- **The chronicle** shows successions and new houses in every realm, and births, marriages and deaths only in the player's own court.
- **Known limits.** Dead characters are kept for family history, so the save grows with time (about 7 MB of family records by AD 1700). The HUD shows the heir's name but not why they're heir (a family tree view is future work).

New concepts needed

IN SHORT

A shopping list of things later systems will need: named settlements, capitals, resources, roads, Might, map overlays and the conquest panel.

- `Settlement` — named populated place: id, name, position, population, tier, founded year, plus a status (`active` / `ruin`) for the hysteresis and ruin rules in Population & settlement engine. Tracked separately from provinces: a province can contain several, and unclaimed or unorganized land carries whichever clusters clear the percentile threshold. Named status survives conquest and loss of ownership.
- **Capitals** — each realm has one country capital, and each organized province has one province capital (its administrative seat). Both are a settlement reference plus a "first designated" record per realm, so the one-time resettlement can't repeat. They drive the growth bonuses in Capital growth bonuses.
- **Resource categories** — coal, ores (iron/copper/tin/gold/silver/lead), water, flora/fauna (timber/game/fish/wild plants), plus categories that tie into the existing civ flavor text rather than inventing a separate trade- goods system later: Kush's iron industry, Nabatea's incense routes. (OPEN) full list not finalized.
- **Infrastructure tier per cell** — none/dirt/gravel/paved/rail/electrified, hard-capped at gravel while unorganized.
- **Might** — see the dedicated section below. Supersedes the standalone "local militia" idea by generalizing it into the domain-split strength score used everywhere annexation resolves, for both realms and raw land.
- **Map overlays** (UI) — a control to switch what the map draws on top of the terrain: Political (today's ownership view, the default), **Regions** (the ancient geographic regions and their names, the only place those names appear; built as a toggle), and later the population heatmap and resource overlays. One overlay active at a time.
- **Floating confirmation panel** (UI) — live Might + resource-icon readout while painting; see Annexation UX, below.

The five simulation systems (realm/province level)

IN SHORT

The five big systems a realm runs on: population, resources, economy, technology and military.

- **Population** (per province, summed from the density field) — how many people there are comes from natural increase (food security, disease, urban penalty, security, land and living standards, burden, health, climate), and where they live from attraction and bounded migration; see Growth drivers. Carries integration/sentiment (freshly conquered = low, decays toward assimilated over years unless suppressed by unrest).
- **Resources** (per province, summed from the density field) — yield type from terrain; gates military unit types and economic output.
- **Economy** (realm-level, aggregated from provinces) — treasury, income (tax from population x output) minus expenses (upkeep, admin cost).
- **Technology** (realm-level) — military / administrative / agriculture tracks; administrative tech is what should eventually cap how much territory a realm can hold before unrest/corruption penalties bite.
- **Military** (realm-level armies drawn from province manpower + resources) — recruited units gated by resources and tech; a leader/general slot extends the existing `Character.traits`, not a new character concept.

Might: the unified strength score

IN SHORT

One strength score per realm or piece of land, split into Land and Naval (Air and Space later), compared whenever someone tries to take land. Unowned land defends with its local population.

The number actually compared whenever annexation resolves. Split into domains that unlock by era: **Land** and **Naval** (both available from the game's 300 BC start — ancient/medieval navies were real, triremes and quinqueremes included, and several starting civs are explicitly maritime powers: Carthage, Rome, the Greek world, Ptolemaic Egypt), **Aerial** (~1900 AD), and eventually **Space**. A domain that hasn't unlocked yet shows as 0/greyed out for every realm equally. The data model carries all four slots from day one (cheap now, expensive to retrofit later) even though two sit inert for a long time. (DECIDED)

(The ~1500 AD instinct isn't wrong, just describes a different thing — true ocean-crossing "Age of Sail" capability, as opposed to Naval Might existing at all. That's a plausible later refinement, e.g. a coastal/riverine vs. blue-water distinction, not something blocking Naval Might being active from turn one.)

Where a Might number comes from depends on what's being measured: - **A realm's own Might** (the attacker, or an organized province's defender) — derived from that realm's Military system (armies, tech, fortification), per domain. - **Unclaimed or unorganized land's Might** (defender only — raw land has no attacker side) — derived directly from local population density: the same per-cell density field already planned under Layers, read live, not a separately baked asset. "Heat map" here describes the *display* (a colored intensity overlay), not a second data source that could drift out of sync with the density field it's reading.

This resolves both open questions from before: - Defense is **not** seat-anchored — it's the whole province's aggregate Might, so beating it (in whichever domain(s) apply — Land and Naval, for a very long time) flips the entire province regardless of exactly which cells got painted, matching the earlier "conquered a state from one city" decision. - Resolution reads as **instant at confirm-time** — one decisive Might comparison when you commit, not a multi-tick siege bar. (Inferred from "confirm… if you can handle it" rather than stated outright — flagging in case a multi-year siege was actually intended.)

One refinement folded back into Layers: since Might for unclaimed land is explicitly meant to reflect *historical* population, the density field itself is sourced from **HYDE** (History Database of the Global Environment — PBL Netherlands Environmental Assessment Agency / Utrecht University), which gives gridded population estimates from 10,000 BCE to the present (HYDE 3.2.1, CC BY 3.0). Free, public, no licensing cost — same footing as the Natural Earth coastline and historical-basemaps borders already in the project. Implementation follows the same pattern as `tools/build_land_mask.py`: a new `tools/build_population_mask.py`-style import step bakes HYDE's grid into textures on this project's own projection. One snapshot is baked per HYDE keyframe the game's timeline covers, starting at 300

BC, since the snapshots double as the `H_hist` keyframes in Population & settlement engine. Terrain-driven estimation is dropped as the source of record; it remains only as a plausible gap-filler if HYDE's resolution turns out too coarse for a specific region. **(DECIDED)**

Annexation UX: fog of war and the floating confirmation panel

IN SHORT

You can't see a target's strength until you start painting over it. Then a floating panel shows the strength and resources of exactly what you've painted, province by province, before you confirm.

A target's Might is hidden until you start painting over it — no defense numbers just from looking at the map. Starting a paint stroke on unclaimed or enemy territory triggers the reveal, and it updates live as the stroke grows or shrinks, reusing the same dirty-cell tracking the ownership proposal paint already has.

While painting, a floating confirmation panel shows, live: - Might per domain for whatever's currently painted (Land and Naval as real numbers; Aerial/Space greyed out at 0 until their era unlocks) - Icons for whichever resource types are present in the currently-painted cells

Confirm stays available regardless of whether you're favored — showing the numbers is about an informed choice, not a blocked action. Losing (per the existing rule below) means the paint snaps back with attrition to the attacker's own Might, not that confirm gets disabled. (DECIDED)

When one stroke spans multiple distinct provinces (or crosses from unclaimed land into an organized enemy province), the panel shows a **breakdown per province** — a separate Might/resource readout for each one touched, not a blended total. Matches how resolution itself happens: each affected province is checked against its own Might independently, so the panel should show exactly what's about to be decided, not an average that hides which individual provinces you can and can't take. (DECIDED)

Annexation resolution

IN SHORT

Conquest stays a brush stroke. On confirm, each province you painted is compared against your Might: win and you take the whole province, lose and the paint snaps back with losses to your army.

Stays a paint action, not a menu. But the *unit of capture is the province*, not the cell, once land is organized: painting/confirming inside an enemy province checks that province's Might (see above — garrison/fortification, derived from the owning realm's military + tech + that province's integration) against the attacker's Might. Beating it flips the *entire* province — every member cell, including ones the brush stroke never touched, keeps its existing `province_id`, population, infrastructure, and settlements, just under a new owning realm (mechanically: the province's owner pointer flips, then a bulk write propagates that to its cells, per the invariant above). Same brush, same immediate feedback — the simulation decides whether paint sticks, at province granularity, not a separate siege UI. (DECIDED)

Unorganized land (enemy-held, but never administered into a province) has no "whole shape" to inherit, so it still resolves locally — per painted cell or contiguous painted blob — against its population-scaled militia. Unclaimed land (no owner at all) resolves the same way, against its own native militia — usually weak given how sparse unclaimed populations tend to be, but not an unconditional freebie either.

This also settles the earlier open question about post-conquest organization: captured organized provinces do **not** reset to unorganized and don't need a separate "decide how to organize this" step. They arrive already organized, under new management, exactly as they were run before.

Since a province is now captured as an atomic whole, **province size is a real balancing lever**: small/numerous provinces make conquest gradual, a few huge provinces make it all-or-nothing and swingy. Worth weighing during Phase 1 (province generation/seeding), not just an implementation detail.

Suggested build order

IN SHORT

The order the systems are built in, each checked in the real game before the next begins. Step 1 (provinces) is done; step 2 (population) is partly done.

1. Province layer (`province_id` grid + brush-editable boundaries), no stats yet — verify rendering/paint behavior only.
2. Density fields (population + resource-type per cell), provinces sum on demand. Population via the engine: HYDE-sourced `H_hist`, `H_sim` seeded from it, blend, then `C * H^k`. Start with `H_sim` static and verify the 300 BC output against HYDE before adding any dynamics. Then the historical ceiling, with a player/non-player split, and capital bonuses; rerun `tools/calibrate_population.py` on the real grid. Then the Growth drivers groundwork: regional totals, conserving migration, and the balance-test harness, before any later system writes a factor score.
3. Unorganized-territory capability gating (the matrix above) + settlements (clustering, percentile naming, hysteresis, ruins), plus the regional floor. (The region mask and Regions overlay were built with the growth drivers, which needed them.)
4. Economy (realm treasury from province sums).
5. Military + tech (army/power score, minimal tech multipliers).
6. Integration/sentiment (decay-toward-assimilated stat).
7. Paint-gated annexation (the resolution function tying 2-6 together).

Status: population engine and growth-driver groundwork built. Built so far: `src/World/PopulationEngine.cs` (stages 1-2, the historical ceiling with player legacy fade, capital bonuses and resettlement, HYDE-based seeding and 25-year natural resettlement, save/load), the growth drivers' two channels with every factor at its baseline (`PopulationEngine.Growth.cs`), the 38 geographic regions (`tools/build_region_mask.py`, `PopulationEngine.Regions.cs`) and the Regions overlay (`MapView.Regions.cs`), `tools/build_population_mask.py` (the HYDE import), the engine wired into world generation, the yearly tick, saves, and a HUD population line, and each real civ's 300 BC capital registered as an existing capital. Covered by `src/Tests/PopulationEngineTest.cs` (toy-world mechanics), `src/Tests/PopulationHydeTest.cs` (the calibration on the real grid) and `src/Tests/PopulationBalanceTest.cs` (the growth drivers' balance tests). Not built yet: stage 3 (clusters, percentile naming, ruins' labels, the regional floor), gameplay systems that write factor scores and attraction (the engine exposes `SetFactor` and `DriverMods` for them; until they exist the world follows history), events that trigger `ApplyShock`, and province capitals. The HYDE 3.2.1 keyframes are baked into `data/population/` (300 BC to 2017 AD, the 300 BC one derived; see MAP_DATA.md), so the engine runs on the real grid: 284,626 land nodes, loaded in ~0.5 s. The whole game is C# (ported from

GDScript with identical results): a yearly population tick takes ~30 ms and generating the world ~3 s. The old known issue (the non-player world lagging HYDE's total as history rose) is gone: regional totals now follow HYDE exactly.

Each phase should be independently verified against the real headless Godot engine (the Godot 4.7.2 .NET build; the session hook installs it) before moving to the next. The tests are under `src/Tests/`, one scene-tree script per suite, run with `godot --headless --path . --script res://src/Tests/<Name>.cs`; each exits with 1 if any check fails.

Your answers of 12 October 2026 (recorded)

72 answers from the Ledger. Built so far: the spoken voice's scripts (below, "Voices"); the rest wait on their systems (see ROADMAP.md).

Buildings and works

- **The road kinds, checked**: Add more kinds between them - Corduroy log roads, cobbles, plank roads, concrete. Say which in the note.
- **Railways**: Their own network, drawn station to station - Very fast for armies and goods, costly, need coal and iron.

Fog of war: what your realm knows

- **What fog hides**: Also the land itself - Unknown coasts and rivers blank, as on ancient maps. *(Built 17 Oct 2026: see "Terra incognita and the fog levels".)*
- **Terra incognita**: At the start your realm knows only what its people knew; the rest is drawn as old maps drew it *(built 17 Oct 2026)*

History: events, people, migrations and new realms

- **How many events**: A few a year, more in crises
- **How events are written**: Quoting the ancient sources where they exist, with a note on what really happened
- **Event chains**: Events lead to others over years (a feud, a prophecy, a scandal)
- **Time and choices**: You have a few months to choose, then the default happens Your note: "Time stops but can be played and then the few months begins, then the default is chosen"
- **Pictures for events**: Public-domain art and photos of ancient places Your note: "I can feed this to image models, just craft a pdf of prompts"
- **History's pull levels**: Four: Faithful, Guided (default), Loose, Free
- **Pulls for different things**: Separate settings for borders, wars, religions, births and disasters
- **Changing the pull mid-game**: Allowed
- **When history is changed**: Later events need their conditions; missing actors are replaced by the closest match
- **Which great people**: Philosophers, scientists, poets, artists, builders, saints and generals Your note: "At least 12 kinds"
- **Great people moving**: They move to realms that offer patronage
- **What great people do**: Each gives an effect (a technology, a building, a book, a victory) during their life

- **Which migrations**: All the major ones - Galatians 279 BC, Cimbri and Teutones 113 BC, Helvetii 58 BC, Goths, Huns, Vandals, Lombards, Slavs, Avars, Bulgars, Arabs, Magyars, Vikings, Seljuks, Mongols.

Interface

- **What pops up**: A window only for major events and choices; the rest in the chronicle and outliner
- **Nested hover cards**: Hover a word in a card for its own card (as in Crusader Kings 3)
- **Hover card timing**: Appear after a short pause; hold a key to pin them
- **What a province's card shows**: As now
- **The Codex**: An in-game encyclopedia on every realm, people, good, unit, tech and great person, with history notes
- **Search**: A search box for places, characters and realms
- **Changeable keys**: Keys for everything, changeable in Settings
- **Interface size**: A size setting for panels and text. *Built 15 Oct 2026*: Settings > Display > Interface size, 80% to 175%; everything on screen grows or shrinks together. The "Needs you" list now sits just above the map and time buttons and shows only as many lines as fit ("...and N more"), so it never covers them at any size.
- **Colour-blind colours**: Colour-blind palettes for the map views Your note: "Try to also craft a mode to ease the strain on my eyes that have issues stemming from scleromyositis"
- **Undo**: Undo orders given this month before time moves
- **Your notes**: Pin notes on the map and in the chronicle
- **A searchable chronicle**: Filter by kind, realm and place, search, and read the whole game's history
- **Statistics screen**: Graphs of everything over time for any realm
- **Realms table columns**: Choose your columns and sort by any
- **Comparing two realms**: Side by side, with graphs
- **Alerts**: Alerts for idle armies, an empty treasury, unrest; each can be switched off Your note: "More toggleable alerts for important issues"
- **Outliner contents**: Armies, fleets, sieges, research, building, envoys, plots, family, with each group collapsible
- **Pinning**: Pin any province, character or realm to the outliner
- **More map views**: Also trade goods, supply, literacy, roads, terrain passability, religion spread, and history's borders
- **Map view keys**: A key for each view and a favourites bar
- **Tutorial depth**: A guided first game covering every system over its first years
- **An adviser**: An adviser at court who suggests what to do, in period voice

Other realms

- **Same rules as you**: Exactly your rules - No discounts, no gifts, no faster refills. If a rival is weak, it is weak.
- **Writing the aims**: A few aims per realm per era, sourced
- **Which ruler traits matter**: The full trait list
- **How your deeds change their view**: Everything counted, shown in their hover card
- **Seeing their plans**: Only what spies and envoys learn
- **Buildings by history**: History's own on their dates, then by need

Provinces

- **What each province kind does**: As history had them - Core: full tax and levies. Conquered: less of both until integrated. Allied city: governs itself, sends troops not tax. Client kingdom: its own king, tribute, may rebel. Temple-state: priests rule, calm and pious, little tax. Colony: your people, fast loyalty, grows slowly. Frontier march: strong garrison, less tax, raises men.
- **Changing a province's kind**: You choose, at a cost and with conditions - A conquered province becomes core when integrated; a client kingdom can be annexed after some years; a frontier march can be made of a border province.
- **Who can govern**: Your family, nobles and courtiers; a governorship of a few neighbouring provinces - As the Roman provinciae or the Persian satrapies; in republics former magistrates (your answer 'Governors in republics').
- **Governors who grow too strong**: Their power grows with years in post, troops and wealth; a strong, disloyal one may refuse recall or rebel - You can recall them before they grow, at the cost of their goodwill.

Saves, speed and data

- **Save size**: Keep everything
- **Named saves**: Any number of named saves
- **Ironman**: An optional one-save mode
- **Speed in later eras**: Allow slower years later
- **A program to share**: A Windows program you can run without Godot, later a store page
- **Mods**: A mods folder that can add or change data

Sound and music

- **Who makes the music**: Generated pieces go in now; you replace any you remake
- **Each culture's instruments**: Yes, each culture its own instruments - Greek: lyre and aulos. Rome: tibia and cornu. Egypt: harp and sistrum. Mesopotamia: harp and lyre. Celts: carnyx and horns.

- **Instruments by situation**: Yes - War: trumpets and horns (salpinx, tuba, cornu, carnyx). Temples: sistrum, cymbals, pipes. Peace and court: lyre, kithara, harp. Feasts: aulos, barbitos, frame drum.
- **Instruments that arrive with history**: When your realm learns them (a technology) - The hydraulis would be a technology you can research.
- **Jingles, bells and cymbals**: your own answer Your note: "This was misunderstood, I told you it was not the generator, it worked fine, the jingling I heard was from other games not the generation"
- **Which sound effects first**: All the 'Now' sounds (46) - Everything the game can already play: about 1,600 credits.
- **How sounds change with the era**: War, ships and crowds change; the interface stays - Bronze and chariots, iron and legions, mail and horses, gunpowder, engines.
- **Sounds by culture**: Yes, for war horns and cries - Celtic carnyx, Roman cornu, Greek salpinx, Persian and Egyptian trumpets.
- **What gets a spoken voice (soon: free for a week)**: As (a), plus a line for every disaster, war and peace in history's own events - About 40,000 characters, two takes 80,000.
- **The narrator's voice**: A narrator for each age (an ancient bard, a medieval chronicler, a modern newsreader)
- **Voices in ancient languages**: Yes, short lines and war cries in their own tongue, subtitles in English - Pronunciation of dead languages is a reconstruction.

War: armies, units and generals

Armies loyal to their general, and veterans' land (built 15 Oct 2026)

Your answers "Yes, loyalty grows with service", "Better morale; and a loyal army may follow its general against you", "Full in 5 years; faster with victories and loot", "Veterans expect land when discharged", "You choose a province; conquered land is best" and "Unrest, and they may follow a rival", with your note on paying them off (`src/Game/ArmyLoyalty.cs`).

- **Loyalty**: each of your own armies (not hired companies) grows loyal to its general by 0.2 a year, plus 0.1 for a victory and 0.1 when it plunders or razes a city. A new general starts again from nothing; an army with no general forgets. A fully loyal army fights 15% better.
- **Turning on you**: from 0.6 loyalty an army may follow its general against the realm (Sulla, Caesar), more likely the more the realm owes it: unpaid soldiers, veterans left without land, a strong rival faction. At most 1 in 4 a year. The army and its general are lost, the rival faction grows, and the province it stands in breaks away under them (unless it is the capital's). The same rules hold for every realm.
- **Veterans**: units with 30% experience or more, sent home, wait for land. In the Armies panel you give them land in one of your provinces: on conquered land they hold it for you (integration rises, 0.03 per 1,000, at most 0.3); on your own people's land farms are taken from their owners (a grudge). While they wait they stir unrest everywhere (0.01 per 1,000, at most 0.2) and the rival faction grows 2 a

year; each year there is a chance they offer to take silver instead (0.05 talents each), less likely the more of them, the more hardened, and if a general leads them. Other realms settle theirs at once.

- Taking specialised goods instead of silver waits on the goods screen work.

Army traditions and guards (built 15 Oct 2026)

Your answers "Each realm builds traditions from its wars that shape its units and generals", "From history, plus earned ones", "Both" (fading and crushing defeats), "Guard units earned by famous veterans or raised by law", "History's plus a generic" and "A few for the realm (2-3)" (`data/traditions.json`, `src/Game/Traditions.cs`).

- **History's traditions** (17): each people starts with its own, e.g. Rome's manipular legion (heavy infantry +10%) and fortified camp (new generals +1 logistics and siegecraft); phalanx and Companions and Alexander's school for the Macedonian kingdoms; masters of the sea for Carthage and the Phoenicians; Rhodian seamanship and Cretan archery for Rhodes and Crete alone; the Numidian horse; the warband's charge; war in the hills (Iberians); peltasts of Thrace; Illyrian raiders; born in the saddle (Scythians, Sarmatians); the Persian horse; archers of Ta-Seti (Kush); desert riders (Arabs, Nabataeans, Sabaeans).
- **Earned traditions**: six victories won chiefly by one arm earn its tradition (+10% for that arm); six cities taken earn masters of siegecraft (sieges 15% faster, new generals +1 siegecraft).
- **Losing them**: a tradition unused for 50 years (its arm fought in no battle) is forgotten; a crushing defeat (the loser lost 40% of its men and three times the winner's dead) breaks the tradition of the arm that was routed, earned ones first.
- **Guards**: history's guard units are the hypaspists, the Silver Shields and the royal agema (Macedonian kingdoms), the Sacred Band (Carthage) and the praetorian cohort (Rome), with a generic royal guard on foot and on horse for everyone. A realm keeps at most three. A unit of famous veterans (80% experience or more) can be made the guard (the Armies panel's Guard button), as Alexander's hypaspists became the Silver Shields; or a guard can be raised at a high price. An army with your guard in it is half as likely to turn on you. Guards are never chosen for armies raised in bulk, so Carthage's line is now Libyan spearmen and the Macedonian kingdoms' phalangites, not all elites.
- Raising guards by law waits on Laws; until then they are raised by paying their price.

Military reforms (built 15 Oct 2026)

Your answers "Offered when conditions match; they happen for other realms on their dates", "Every reform we can source to 1 AD", "History's causes plus a technology", "Silver, years to take effect, and the estates' anger", "You can take it later from a reforms list" and "Your rival's strength rises" (`data/military_reforms.json`, `src/Game/Reforms.cs`).

25 reforms from 300 BC to 1 AD, each its realm's own, each with its source: Rome's velites (211 BC), Scipio's Spanish drill, Gaius Gracchus' military law (123 BC), the Marian reforms (107 BC; needs the cohort), citizenship for the Italian allies (89 BC), Pompey's command at sea (67 BC) and Augustus' standing army (13 BC; needs the professional army); Ptolemy IV's Egyptian phalanx (217 BC), the Seleucid cataphracts and Antiochus IV's Roman-armed men, Philip V's rebuilding of Macedon; the thureos shield

(Aetolians), Cleomenes' and Nabis' revolutions at Sparta, Hiero's army and Archimedes' engines at Syracuse, Pyrrhus' mixed line; Xanthippus' drill and the Barcid army of Spain (Carthage); Masinissa's kingdom and Juba's legions (Numidia), Mithridates' Roman-style army, Tigranes' army, Burebista's union of the Getae, Viriathus' way of war, Vercingetorix's levy.

- **Your realm** is offered a reform when its cause from history is present (five years at war; war with Carthage; men running short; a heavy defeat, or one by Rome; a restless Italian province; pirates at sea; an army having turned on you; holding Iberian or Median land; a battle against Celts; ten years of peace) and it knows the technology, if one is named. The Armies panel lists it: begin it (its silver now, the rival faction grows at once, the effect in its 1-5 years), or leave it there to take later.
- **Other realms** take theirs in history's year.
- **Effects**: men to call up and army pay (the realm's call-up and upkeep change), how fast armies grow loyal to their generals (the Marian reforms faster, Augustus' standing army slower), veterans paid in silver from the treasury instead of land (Augustus), an arm's strength, garrisons, unrest.

Where units are raised (built 15 Oct 2026)

Your answers "In provinces whose people make them, then marched to the army", "1 month for levies, 3-6 for trained troops" and "They walk by themselves, arriving after the travel time" (your note: they leave in sets, a unit's men together) (`src/Game/Muster.cs`). The same for every realm.

- A unit is raised in the nearest of the realm's provinces whose people fight that way (legionaries in Latin provinces, Numidian horse in Numidian ones; units anyone raises, in the nearest province of all); if none of its provinces' people do, where the army stands.
- It is paid for and its men called up at once, and paid upkeep from that day. It trains: levies 1 month; archers, slingers and light foot 3; heavy foot 4; horse and horse archers 5; elephants and ships 6.
- Then it walks to its army, about 600 km a month, and joins it on arrival; if the army is gone, it joins the realm's largest, or founds a new army in its province. The Raise menu says where each unit would come from and how long it takes; the army shows what is on the way.
- **Retraining old units**: The price difference and months of training; keeps half their experience
- **Slave soldiers**: Both
- **How traditions form**: From history, plus earned ones
- **Losing traditions**: Both
- **Order of modern arms**: When the timeline reaches gunpowder
- **Other realms and nuclear weapons**: As history: never used after 1945 unless you use them first Your note: "Also in extremis, a nuclear capable state won't let its history be destroyed without using its last resort, so any nuclear capable realm has a chance of using one that increases as it loses large swathes of provinces. There will also be terrorist states in the game starting around 1900 like in the real world."

Voices (all 1024 lines voiced, 13 Oct 2026)

From What gets a spoken voice, The narrator's voice, Voices in ancient languages and An adviser:

- **The script**: 206 lines, about 19,300 characters, in `data/voice_lines.json` (built by `tools/voice/build_lines.py`; a readable copy is `docs/Voice-script.md`): the opening history lesson in seven scenes (Göbekli Tepe, the first grain and Jericho, Çatalhöyük, the rivers and Eridu, Uruk and writing, the first states, and a bridge to 300 BC), 8 tips and 11 first steps, 5 new ages, 38 wonders finished, 53 disasters, and the start and the peace of history's 38 wars, plus 8 war cries.
- **More lines** (13 Oct 2026), 255 more for 461 in all (about 35,600 characters): a history lesson by the bard for each of 11 great figures (Sargon to Alexander); 31 moments of play (a battle won or lost, a siege, a city taken, a revolt, a ruler's death, an heir, a marriage, a new art, a famine, a plague and more), each told two or three ways by each of the three narrators; 27 longer lessons from the adviser, one for each part of the game; 12 warnings from the adviser (an empty treasury, a province near revolt, unpaid soldiers, no heir…); and 4 victory cries (Io triumphe, Victoria, Nike, Ie Paian).
- **Still more lines** (13 Oct 2026), 175 more for 636 in all (about 43,300 characters): 23 more moments told two ways by each narrator (sea battles won and lost, a fleet lost to a storm, an army destroyed, a general's death, a revolt crushed, a province breaking away, a new vassal, a broken alliance or truce, a new trade route, pirates, raids, flood, drought, fire, a good harvest, a golden age, an assassination, civil war, a conquered people won over, a city founded, a new religion, a great victory); 15 more warnings from the adviser; and 16 replies and greetings from the adviser ("As you command, my lord", "We cannot afford it, my lord", "Another year has passed").
- **The opening, spoken when you pause** (13 Oct 2026), 137 more for 773 in all: when you pause the opening and click a place or a step for its explanation, the most important part is read aloud by the bard alongside the text. 38 ancient places (Göbekli Tepe, Jericho, Çatalhöyük, Eridu, Uruk and 33 more), 18 steps of the story (hunters, gathering, villages, crops, herds, pottery, irrigation, copper, temples, war, the plough, sails, cities, writing…), 8 years spoken slowly as the clock passes them ("Ten thousand years before Christ"), and 3 help lines (how to pause, change speed and go on). Also 56 realm introductions, one for each realm you can pick at 300 BC (Carthage, Egypt, Seleukos, Rome, the Arabian incense kingdoms and the rest), and 14 Bronze Age moments for earlier starts (the Sea Peoples, the tin trade cut, a palace burned, learning bronze, iron, writing and the chariot).
- **The story goes on, battles and the turning year** (13 Oct 2026), 111 more for 884 in all: 28 more history lessons after 300 BC, each read by the narrator of its own age (the Punic wars, Caesar, Augustus, the fall of the west, Justinian, Islam, the Vikings, Charlemagne, the crusades, the Mongols, the Black Death, 1453, printing, the voyages, the Reformation, Westphalia, the revolution, Napoleon, industry, the two world wars, the Cold War and our own times); 12 moments of a battle told by each narrator (the armies meet, a cavalry charge, a flank turned, our line breaking, the reserves, a rout either way, a general falls, a standard taken, nightfall, the pursuit) plus 2 for war elephants; spring, autumn, winter quarters and a new century; the end of a fallen realm; 8 more years for earlier starts (3000 to 300 BC); 8 more lessons and 6 more warnings from the adviser (faith, mercenaries, vassals, succession, spies, colonies, granaries, festivals); and 8 envoys' answers (accepted, refused, insulted, an alliance or marriage offered, peace asked for).

- **At sea, at the walls, in the market and at court** (13 Oct 2026), 67 more for 951 in all, each told once by each narrator: at sea (ramming or boarding, a ship lost, the enemy fleet fleeing, a blockade, a landing); at the walls (a breach, a failed assault, a sally, a surrender, a siege lifted); in the market (a boom, prices soaring, a bank failing, treasure found); and at court (a ruler coming of age, a regency, a ruler ill, a ruler honoured, a plot uncovered). Also 10 more short answers from the adviser ("The treasury is full", "We have no ships there", "It is too far", "Rest well, my lord").
- **Great discoveries, faith and more tips** (13 Oct 2026), 58 more for 1009 in all: 40 milestones of the tech tree announced by the narrator of their age (the arch, concrete, the stirrup, paper, algebra, the compass, gunpowder, printing, the telescope, the steam engine, vaccination, railways, electricity, the atomic bomb, space flight and more); a temple built, pilgrims, a heresy put down and a festival, told by each narrator; and 6 more tips from the adviser. Then 15 more short adviser replies ("Good news, my lord!", "Bad news, my lord", "A letter has come for you").
- **The voices you chose** (12 Oct 2026): bard 2, chronicler 2, newsreader 1, adviser 1, warrior 2, all saved in the ElevenLabs voice library.
- **Narrators by age**: the bard speaks for anything before 600, the chronicler from 600 to 1800, the newsreader from 1800. A line belongs to the year history gives it (a wonder's narrator is set by the year history finished it, even if you finish it sooner).
- **The adviser at court** speaks the tutorial, in period voice.
- **War cries in their own tongue** (Latin, Greek, Punic, Gaulish), with English subtitles; the pronunciation is a reconstruction.
- **Wonder lines name no builder**, since anyone may finish them; war lines say only that peace is made, since history may not repeat.
- Two takes of each line, made with ElevenLabs' newest voice model (free while the credits last), saved as `assets/voice/<line>.mp3` and `assets/voice/takes/<line>_b.mp3`.

Hearing them in the game (13 Oct 2026)

- **What is spoken**: the news in the chronicle. Each year (or month) the narrator of the year reads out the most important item, in this order: a new age; the start or end of one of history's own wars; a disaster from history (by name); a wonder finished; a great discovery of yours; then the moments of your own realm (a battle or sea fight won or lost, war declared by you or on you, a siege begun or lifted, a city taken or lost, peace, an alliance, a vassal, a ruler's death, a new house, an heir born, a marriage, a revolt, a wonder begun or fallen, a building or goal finished). A new century is greeted when nothing else happened. Other realms' battles and families stay silent; history's wars, disasters and wonders are told to all.
- **Also spoken**: the adviser reads each first step of the tutorial and each tip; choosing a realm plays its introduction; the end of the game (or the fall of your realm) has its last word.
- **The opening's lines** (scenes, years, places, steps, help) play in the opening (see "The opening").
- **Not yet spoken** (their systems aren't built): the adviser's warnings, lessons and replies, envoys' answers, history lessons, war and victory cries. Great works (canals, dams) have no lines of their own

and use "the work is finished".

- **One line at a time**: while one is spoken, at most one more waits; anything more is dropped, so speech never falls behind play.
- **Settings, Audio**: "Narrators speak" (on/off) and "Voice Volume".
- **The Voices screen** (main menu): every line with its words, ▸ A and ▸ B to listen, and "Use A" or "Use B" to choose. Filters by group and by speaker, and "Only lines not yet chosen". A line not chosen plays take A. Run from the Godot editor, choices are saved at once in `data/voice_picks.json` (commit it with GitHub Desktop to keep them); in an exported game, in the player's own folder.
- **No credits**: playing, choosing and the game itself only use the recordings already in the project; nothing generates speech.
- Take B stays out of Godot's import (`assets/voice/takes/.gdignore`) and is read straight from its file. When the game is first exported, the export needs `assets/voice/takes/*.mp3` in its "files to include" so chosen B takes travel with it.

The interface's ornament (your rules, 14 Oct 2026; tool built)

You chose the Fresco look (warm plaster, a band of ornament across the top of each panel, a short rule under headings, rows told apart by a faint tint), but with real ornament, varied by people and by age. Your rules:

- **Only the original objects**: photographs of things the people made themselves (painted pottery, mosaics, tiles, textiles, carving, manuscripts), each with its museum record (object, people, place, date, museum number) as the proof.
- **No 19th-century pattern books** (Owen Jones's *Grammar of Ornament*, Racinet, Meyer): European artists' redrawings, not the ornament itself.
- **No modern recreations**: no facsimiles, replicas, casts or reconstructions. If there isn't enough proof of how it looked, it isn't used.
- **Nothing redrawn**; a band keeps its own way up (a hanging band goes on a top edge only); its date must fit the people and age it stands for.

The tool is `tools/ornament/ornament.py`; how to use it is in `.claude/skills/ornament/SKILL.md`. It searches the Met and the Cleveland Museum of Art (both public domain), refuses facsimiles and copies, keeps each object's record and writes the credits. First strip: the hatched meander round the rim of an Athenian krater of about 750–735 BCE (the Met, 14.130.14).

Your answers of 15 October 2026 (recorded)

Forty questions you answered on the Ledger (read 15 Oct 2026). Each becomes its feature's instructions; your notes win where they differ.

Culture and religion

- **New religions**: They arise where history had them; if that place is gone, nearby in similar conditions.
- **Missionaries**: Send missionaries (characters) to provinces or courts.
- **Speed of conversion**: Slow, with bursts when rulers convert.

History: events, peoples, migrations and new realms

- **How migrating peoples behave**: They seek land: they raid, fight or settle, and can be bargained with.
- **Answering a migration**: Fight, pay, or settle them as allies on your land.
- **Playing a migrating people**: Yes, lead a people to new land.
- **History's new realms in your land**: Only if unrest and conditions are there: Parthia rises only if your hold on Parthia is weak.
- **Names for new realms**: History's name where one exists, else from their people and land.
- **Civil wars**: The realm splits between claimants; you pick a side or lead one.
- **Pretenders**: Claimants, real or false, raise support and armies.
- **Great collapses**: Collapses happen when strain builds, not on a date. Your note: "All major collapses still happen on their dates, for the player realm too, we have to come up with options for the player for each collapse, so the game continues."
- **Disaster effects**: Earthquakes ruin buildings and harbours; eruptions bury towns and darken skies; plagues shake faiths and labour; famines raise prices and riots.
- **Your answers to disasters**: Relief, rebuilding, prayer and scapegoats, each with costs.
- **Omens and warnings**: your own answer. Your note: "Only if the signs actually matched disasters, such as retreating water prior to a tsunami, maybe they thought it was Poseidon drinking it up, but a red fox walking down a red road before an earthquake no matter the accompanying story, is not a real omen. If that makes sense"
- **Slave revolts**: History's revolts happen where their conditions exist.
- **Unrest of the enslaved in your realm**: Full revolts can happen.
- **History checks across all eras**: Hundreds of checkpoints across all eras.
- **Later borders**: Draw key dates from our districts by hand from the sources.

Treasury and money

- **How a monopoly works**: Both, chosen for each good: Run some monopolies yourself and farm out others, as the Ptolemies and Romans did.

- **Which goods can be monopolised**: History's list, plus any other at a higher cost: History's monopolies come easily; others are possible but anger the people and the merchants more.

War: campaigns, marching, supply and sieges

- **Occupation until the peace**: Occupation during war, handed over by the treaty: War score counts what you hold.
- **Siege choices**: Starve, storm or mine; build works and engines; defenders may sally or surrender on terms.

War: generals

- **How generals earn perks**: A chance after each victory, fitting how he won: E.g. winning with cavalry may give 'cavalry commander'.
- **How generals gain skill**: Tactics from battles, siegecraft from sieges, logistics from long marches: Each skill grows from its own work.
- **What defeat teaches**: Both.
- **How many waiting generals**: One per 5 armies, at least 2.
- **Who picks generals, by government**: As above, plus Carthage's council choosing and punishing generals.
- **Rome's yearly consuls**: Elected yearly; you can ask the Senate to prorogue: Costs influence; may be refused.
- **Carthage crucifying failed generals**: Yes, as your choice (with consequences).
- **Admirals' skills**: your own answer. Your note: "Their own, same amount as generals, obviously a few overlapping"
- **Who can be an admiral**: Anyone; skills decide. Your note: "It is not easy nor common to excel in both, but possible to excel in all including air and space eventually"
- **What men of prowess can be**: Also engineers and admirals.
- **How often men of prowess arrive**: On history's dates, plus rarely by chance: E.g. Xanthippus 255 BC.

War: pretexts, peace and treaties

- **Offers to appease**: Offers of silver, hostages, a province or submission, as history's embassies did.
- **How often you are offered peace**: Whenever the other side's situation changes enough.
- **Making claims**: Claims can be forged or dug up by your officials, at a cost and risk.
- **Aggression fading**: Aggression fades faster with peace and good deeds.
- **Vassals' freedom**: Levels from ally to province-in-waiting; you tighten or loosen them.
- **Absorbing vassals**: Vassals can be absorbed over years, or bequeathed.
- **Allies' duty**: Allies must answer or lose trust; defensive and offensive alliances differ.

Your answers of 15 October 2026, second set (recorded)

Twelve of the new follow-up questions, answered while the work went on.

Saves, speed and data

- **Autosaves**: A setting (you choose how often). Already in Settings: every 5, 10, 15, 20 or 25 years, or off.
- **Keeping history in saves** *(built, 15 Oct 2026, with "Save size: keep everything")*: a setting, "Thin out old years" (Settings, Gameplay), off at first. Saves now keep everything: the whole chronicle as you read it (before, it wasn't saved at all, and a loaded game's chronicle began empty), every battle report (before, the last 300) and every province's history (before, its last 300 entries). With the setting on, every tenth year the game thins years more than a century old: the chronicle keeps only wars, peace, conquests, revolts, disasters and successions; battle reports keep their numbers but lose the blow-by-blow; a province keeps one entry a decade; each realm's graphs keep every 25th year.
- **What mods can change**: Data first, pictures and sounds later.
- **A store page**: Later, when the game is ready.

Time and turns

- **Clock speeds** *(built, 15 Oct 2026)*: Five speeds, from a week a second to a year a second (1 wk/s, 1 mo/s, 3 mo/s, 6 mo/s, 1 yr/s; click the speed button for the next), with time stopping by itself for what needs you, as before.
- **What stops time** *(built, 18 Oct 2026)*: Settings > Time lists what can stop the clock (or end a turn of several years early) when it happens to your realm, each with a tick: your ruler dies, war is declared, land changes hands, a revolt, a disaster, famine or desertion (ticked at first, as before), and peace is made, a child is born, a marriage, a death in the family and each new year (unticked at first). Your own battles, when you fight them yourself, and the end of the game always stop it.
- **Named saves** *(built, 18 Oct 2026)*: you can keep any number of saves. Save Game (in the Esc menu) has a box for the save's name, filled in with your realm and the year ("Rome 208 BC"); type over it and press Save. Below it are your saves, newest first, to save over or delete. A name already used asks before overwriting. Load Game lists every save, autosaves included, and scrolls when there are many. Saves from the old Slot 1 to 3 are still listed and load as before.
- **Why they did that** *(built, 18 Oct 2026)*: rest the mouse on a realm's name in a hover card and its card shows its first three aims, each with its reason ("War on Kassander's Macedon: Demetrios Poliorcetes seizes the throne of Macedon (294 BC)."); click "all their aims" for the rest. Aims are its wars (attacking, holding off an attacker, called in by an ally, and whether it is losing and would take peace), history's campaigns now due that it hasn't begun (and what holds it back), old grudges, and its purse (debts, a full treasury, a war chest). Under the diplomacy fog you see only what your realm knows: nothing of a realm it doesn't know; wars and grudges of one it knows roughly; everything of one it knows well (a neighbour or trading partner). Spies and envoys will add to this when they come. Each

war now keeps why it was declared, in saves too. The realms screen (L) shows the same aims for the two realms compared side by side.

- **Colour-blind colours** *(built, 18 Oct 2026)*: Settings > Display > Map view colours: as usual, red-green colour blindness (the most common kind: the scales run orange to blue instead of red to green) or blue-yellow colour blindness (red to teal). The named colours (cultures, religions, trade goods) then come from Okabe and Ito's eight colours, chosen so every kind of colour blindness tells them apart, in three shades and toned down so they don't glare; each name shown takes the next in alphabetical order, so the first 24 never share a colour. The diplomacy view has its own colour-blind colours. The political map keeps history's colours for the realms (their borders and names tell them apart). Your eye-strain mode waits on its own question ("The eye-strain mode").
- **Alliances** *(built, 18 Oct 2026)*: the other realms seek allies against rivals and threats. Each year a realm with a rival, a neighbour it fears or an enemy at war has a one-in-five chance to look among the realms it deals with for one that counts the same realm a threat and thinks well of it (opinion 25 or more); they swear an alliance against it, and the chronicle says so. A realm makes at most three such alliances (history's alliances of 300 BC don't count), never with your realm (your alliances come by offer, as before), and none while it is a vassal. Allies are called into each other's defensive wars. A realm's card lists these alliances among its aims. (How long treaties last and what breaking one costs wait on their own questions.)
- **Peace sense** *(built, 18 Oct 2026)*: the other realms make peace with each other when both sides want it enough, weighing the war score (a side losing badly wants it above all), half their war weariness, every other war they aren't winning, and their aims (the attacker's campaign over or won; the defender holding its own), plus a little for a war over eight years old. After 25 years any war ends. Wars with you end by offers and terms, as before.
- **Rulers' character** *(built, 18 Oct 2026)*: the other realms' choices follow their ruler's traits. Boldness runs from -3 to +3: one step for each of brave, reckless, rash, fearless, ambitious, wrathful, arrogant, proud and energetic, less one for each of cautious, craven, timid, patient, calm, content, slothful, languid and humble. Each step makes a ruler strike history's campaigns with 12% less strength than he would otherwise wait for (a cautious one waits for more), fall on a weak neighbour sooner, and want peace less (8 points of the peace wish). A realm's card says so: "It waits until it is strong enough; its ruler, Pyrrhus, is bold and won't wait long." A new ruler brings his own temper. (How the traits are grouped waits on "Kinds of traits".)
- **Same rules as you** *(checked, 18 Oct 2026)*: the realms the computer runs pay the same for armies, refill manpower at the same pace and get no unseen gifts. The one difference found was that only your provinces could revolt; now every realm's restless provinces may rise and break away by the same chance (13 revolts across the world in a 30-year test, every realm still standing). Where the rules ask for a choice (research, where merchants go, settling veterans) the computer makes it for them.
- **Realms that lost their role** *(as built)*: history's aims die with the realm. A campaign belongs to its realm; if that realm falls, no one takes it up, and a campaign against a realm that no longer holds land does nothing.
- **Weeks**: Armies and fleets move, and fight, by the week.

Technology and knowledge

- **Movement list**: Every age's great movements, built era by era, starting with the ancient philosophies.
- **Education and research**: Four education levels now (none, letters, schooled, learned), six as the ages bring universities.
- **Knowledge that was lost**: About 20 sourced, each with a lesser replacement that can be found again.
- **Inventions arriving** *(built, 15 Oct 2026)*: The more trade with where it came from, the cheaper to research once it arrives: up to 40% less, by the share of your trade partners who know it, and the whole 40% if you hold the land it enters by. This comes on top of the neighbours' discount.

War: manpower (built, 15 Oct 2026)

- **Wounded share**: By outcome and medicine. A beaten army's fallen are half killed (the slaughter of the rout), a victor's a quarter, as before; now each realm's medicine saves some of those who would die (bronze surgery from 200 BC 5%, the legions' hospitals 15%, Galen 5%, the bimaristans 5%, Paré 10%, anaesthesia 10%, nursing 10%, germ theory 10%, antibiotics 15%; at most 70% together). The same care saves those who would die of their wounds later.
- **Wounded returning**: Months, and some never. Each month a quarter of the wounded return to the line, 3% die of their wounds and 4% are crippled and go home: alive among their people, but lost to the army. Of every hundred wounded about 77 fight again, 13 go home maimed and 10 die.

Your answers of 16 October 2026 (recorded)

Answered on the Ledger while the work went on (and four older answers whose features had been left marked as waiting). Each feature is now ready to build.

- **Passes, fords and straits** (The map): Both.
- **Forests shrinking and growing** (Land, resources and goods): Visibly on the terrain map.
- **Coal, oil and the modern resources** (Land, resources and goods): Found by prospecting. Your note: "tech and prospecting available according to when history says".
- **Levies and standing armies** (War: armies, units and generals): Levies raised for a campaign and sent home; standing troops kept all year, as each realm's laws allow.
- **Others' aims** (Other realms): Both.
- **Why they did that, in detail** (Other realms): Three, with more on click.
- **Grudges** (Other realms): Yes, fading over generations.
- **New rulers, new policies** (Other realms): Yes, by the new ruler's traits. Your note: "any governing bodies and peoples making up those bodies change only a little, and have to be persuaded further".
- **Coalitions against you** (Other realms): Yes, by fear and history.
- **Spies** (Fog of war: what your realm knows): A spymaster plus a network.
- **Spy actions** (Fog of war: what your realm knows): Those, plus sabotage and murder.
- **Explorers** (Fog of war: what your realm knows): History's explorers plus yours.
- **Old maps** (Fog of war: what your realm knows): Your culture's where known.
- **How fast news travels** (Fog of war: what your realm knows): Yes, roads and posts.
- **The opening's sites** (The Bronze Age): 20 first, more later.
- **Bronze Age palaces** (The Bronze Age): As above, and they can fall.
- **Mercenary contracts** (War: mercenaries): Yes, months you choose.
- **Expensive companies** (War: mercenaries): Both.
- **Mercenary loyalty** (War: mercenaries): Yes, slowly.
- **A captain taking a throne** (War: mercenaries): Yes, if unpaid or slighted.
- **Veteran colonies** (War: veterans): Either.
- **Veterans as reserves** (War: veterans): Yes, from their colony. Your note: "with consequences".
- **Sound takes** (Sound and music): Both, you can drop one.
- **The music ledger** (Sound and music): Per culture first, situations later.
- **Spoken lines** (Sound and music): Narrator for history, adviser for you.
- **Aims order** (Other realms): Great powers first, then the rest.
- **Stealing techs** (Technology and knowledge): Any, harder for secrets.
- **The look by era** (Interface: the look): At once, with a show.

- **Ornament by people** (Interface: the look): Yes. Your note: "They don't only have to be direct photographs, but if it is illustrated it needs sources that prove it actually looked like the illustration".
- **Fog setting choices** (Fog of war: what your realm knows): Separate for map and diplomacy. Your note: "will corresponding off, light and full options".

Your answers of 18 October 2026 (recorded)

Answered on the Ledger while the work went on. Each feature is now ready to build.

- **History book writing** (Goals, score and the end): Both, as two parts: a narrative and the full chronicle.
- **Era summary style** (Goals, score and the end): A page, narrated if you wish.
- **Starter goals** (Goals, score and the end): About 10 shared goals plus each great realm's own.
- **How close to history** (Goals, score and the end): By borders, events and people: which great people lived.
- **Score parts** (Goals, score and the end): Eight, adding how close you stayed to history. Your note: "history's closeness should be toggleable".
- **The other start dates** (Goals, score and the end): 44 BC, Caesar's death, is built first.
